## Programs

## Students

July 12, Saturday
Whole day
Arrivals
July 13, Sunday

09:00
10:00-11:30
12:00-14:00
14:00-18:00
21:00-22:00
July 14, Monday
Whole day
July 15, Tuesday
08:00
09:00-14:00
Afternoon
July 16, Wednesday
Whole day
July 17, Thursday
08:00 Departure for the theoretical exam
09:00-14:00 Theoretical exam, Eötvös Loránd University
15:00-17:00
Free time
18:00-22:00
July 18, Friday
Whole day Excursion to Visegrád and Szentendre
July 19, Saturday
Whole day Excursion to Eger and Szilvásvárad
July 20, Sunday

| 13:00 | Departure for the Closing Ceremony |
| :--- | :--- |
| 15:00-17:00 | Closing Ceremony, Eötvös Loránd University |
| 18:00-22:00 | Banquet, Railway Museum |

July 21, Monday
Whole day
Departure for the Opening Ceremony
Opening Ceremony, Madách Theatre
Welcome reception, Eötvös Loránd University
Sightseeing
Lab safety instruction

Excursion to Lake Balaton

Departure for the practical exam
Practical exam, Eötvös Loránd University
Free time

Sport- and team-building day

Re-union party, Európa Ship

Departures

## Mentors

July 12, Saturday
Whole day
Arrivals
July 13, Sunday

| 09:00 | Departure for the Opening Ceremony |
| :--- | :--- |
| 10:00-11:30 | Opening Ceremony, Madách Theatre |
| 12:00-14:00 | Welcome reception, Eötvös Loránd University |
| 14:00-15:00 | Lab inspection, Eötvös Loránd University |
| 16:30-17:30 | Meeting with authors, hotel |
| 19:00-23:00 | $1^{\text {st }}$ Jury Meeting, hotel |

July 14, Monday
09:00-17:30
18:00-22:00
Translation, hotel
Dinner with wine in Szentendre
July 15, Tuesday
09:00-12:00
14:00-17:30
Sightseeing
19:00-23:00
Discussion with authors, hotel
$2^{\text {nd }}$ Jury Meeting, hotel
July 16, Wednesday
Whole day Translation, hotel
July 17, Thursday
08:00-16:00 Excursion to Győr and Pannonhalma
18:00-22:00 Re-union party, Európa Ship
July 18, Friday
13:00-14:00
$3^{\text {rd }}$ Jury Meeting, hotel
17:00-22:00 Excursion to Visegrád
July 19, Saturday
Whole day
19:30-22:00
Arbitration, hotel
$4^{\text {th }}$ Jury Meeting, hotel
July 20, Sunday

| 13:00 | Departure for the Closing Ceremony |
| :--- | :--- |
| 15:00-17:00 | Closing Ceremony, Eötvös Loránd University |
| 18:00-22:00 | Banquet, Railway Museum |

July 21, Monday
Whole day Departures

## Guests

July 12, Saturday
Whole day
Arrivals
July 13, Sunday
09:00 Departure for the Opening Ceremony
10:00-11:30
Opening Ceremony, Madách Theatre
12:00-14:00
Welcome reception, Eötvös Loránd University
14:30-18:00
July 14, Monday
Whole day
18:00-22:00
Excursion to Szentendre
Dinner with wine in Szentendre, together with the mentors
July 15, Tuesday
09:00-12:00
Sightseeing
15:00-16:00
Visiting the House of Parliament
July 16, Wednesday
Whole day
Puszta-tour
July 17, Thursday
08:00-16:00 Excursion to Győr and Pannonhalma, together with the mentors
18:00-22:00 Re-union party, Európa Ship
July 18, Friday
10:00-17:00 Excursion to Esztergom
17:00-22:00 Excursion to Visegrád, together with the mentors
July 19, Saturday
Whole day
Excursion to Eger and Szilvásvárad
July 20, Sunday

| 13:00 | Departure for the Closing Ceremony |
| :--- | :--- |
| 15:00-17:00 | Closing Ceremony, Eötvös Loránd University |
| 18:00-22:00 | Banquet, Railway Museum |

Whole day Departures

## Theoretical problems

## Instructions

- Write your name and code on each page.
- You have 5 hours to work on the problems. Begin only when the START command is given.
- Use only the pen and calculator provided.
- All results must be written in the appropriate boxes. Anything written elsewhere will not be graded. Use the reverse of the sheets if you need scratch paper.
- Write relevant calculations in the appropriate boxes when necessary. If you provide only correct end results for complicated problems, you receive no score.
- When you have finished the examination, you must put your papers into the envelope provided. Do not seal the envelope.
- You must stop your work immediately when the STOP command is given. A delay in doing this by 3 minutes may lead to cancellation of your exam.
- Do not leave your seat until permitted by the supervisors.
- This examination has 26 pages.
- The official English version of this examination is available on request only for clarification.

## Constants and Formulae

Avogadro
constant:
Gas constant: $\quad R=8.314 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1} \quad$ Gibbs energy: $\quad G=H-T S$

Faraday constant: $\quad F=96485 \mathrm{C} \mathrm{mol}^{-1} \quad \Delta_{\mathrm{r}} G^{\circ}=-R T \ln K=-n F E_{\text {cell }}^{o}$
Planck constant: $\quad h=6.626 \cdot 10^{-34} \mathrm{~J} \mathrm{~s}$
Nernst equation:

$$
E=E^{o}+\frac{R T}{z F} \ln \frac{c_{\mathrm{ox}}}{c_{\mathrm{red}}}
$$

Speed of light:
$c=3.000 \cdot 10^{8} \mathrm{~m} \mathrm{~s}^{-1}$
Energy of a photon: $E=\frac{h c}{\lambda}$
Zero of the Celsius scale:
$N_{\mathrm{A}}=6.022 \cdot 10^{23} \mathrm{~mol}^{-1} \quad$ Ideal gas equation: $\quad \mathrm{p} V=n R T$

In equilibrium constant calculations all concentrations are referenced to a standard concentration of $1 \mathrm{~mol} / \mathrm{dm}^{3}$. Consider all gases ideal throughout the exam.

Periodic table with relative atomic masses

## Problem 1

## 6\% of the total

| 1a | 1b | 1c | 1d | Task 1 |
| :--- | :--- | :--- | :--- | :--- |
| 4 | 2 | 8 | 8 | 22 |
|  |  |  |  |  |

The label on a bottle containing a dilute aqueous solution of an acid became damaged. Only its concentration was readable. A pH meter was nearby, and a quick measurement showed that the hydrogen ion concentration is equal to the value on the label.
a) Give the formulae of four acids that could have been in the solution if the pH changed one unit after a tenfold dilution.

Any univalent, strong acid $(\mathrm{HCl}$, $\mathrm{HBr}, \mathrm{HI}, \mathrm{HNO}_{3}, \mathrm{HClO}_{4}$ ) is acceptable. HF is not!
b) Could it be possible that the dilute solution contained sulfuric acid?

Sulfuric acid: $\mathrm{pK} \mathrm{a}_{\mathrm{a} 2}=1.99$
$\square$ Yes $\square$ $\square$ No

If yes, calculate the pH (or at least try to estimate it) and show your work.
No, the first dissociation step can be regarded as complete in aqueous solutions, thus $\left[\mathrm{H}^{+}\right]>C_{\text {acid }}$.

2 points are given for 'No'.
No text or calculations are needed later, and no pts will be given here.
pH :
c) Could it be possible that the solution contained acetic acid?

Acetic acid: $\quad \mathrm{p} K_{\mathrm{a}}=4.76$YesNo
If yes, calculate the pH (or at least try to estimate it) and show your work.

Yes, but only in quite dilute solutions can this happen. 1 pt for ticking yes

$$
\begin{align*}
& c=[\mathrm{HA}]+\left[\mathrm{A}^{-}\right]=\left[\mathrm{H}^{+}\right]  \tag{1pt}\\
& {\left[\mathrm{H}^{+}\right]=\left[\mathrm{A}^{-}\right]+\left[\mathrm{OH}^{-}\right]} \tag{1pt}
\end{align*}
$$

This means that $[\mathrm{HA}]=\left[\mathrm{OH}^{-}\right]$
Formula:
$K=\frac{\left[\mathrm{H}^{+}\right]\left[\mathrm{A}^{-}\right]}{[\mathrm{HA}]}=\frac{\left[\mathrm{H}^{+}\right]\left(\left[\mathrm{H}^{+}\right]-\left[\mathrm{OH}^{-}\right]\right)}{\left[\mathrm{OH}^{-}\right]}=\frac{\left[\mathrm{H}^{+}\right]^{3}}{K_{\mathrm{w}}}-\left[\mathrm{H}^{+}\right] \quad(2 \mathrm{pt})$
The pH of the solution must be acidic, but close to 7 .
6.5 is a good guess. ( 1 pt for reasonable guess - between 6 and 7 )

A good approximation is: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(K K_{w}\right)}$
The full equation can be solved through iteration: $\left[\mathrm{H}^{+}\right]=\sqrt[3]{\left(\mathrm{K}+\left[\mathrm{H}^{+}\right]\right) K_{w}}$
Starting with a neutral solution two cycles of iteration give identical results:
$5.64 \cdot 10^{-7} \mathrm{~mol} / \mathrm{dm}^{3}$ as the required concentration. Exact pH is 6.25 . 3 pts
pH :
d) Could it be possible that the solution contained EDTA (ethylene diamino tetraacetic acid)? You may use reasonable approximations.
EDTA: $\mathrm{p} K_{\mathrm{a} 1}=1.70, \mathrm{p} K_{\mathrm{a} 2}=2.60, \mathrm{p} K_{\mathrm{a} 3}=6.30, \mathrm{p} K_{\mathrm{a} 4}=10.60$Yes $\qquad$ No

If yes, calculate the concentration.

| Yes (1 pt) <br> We can suppose that this solution would be quite acidic, so the $3^{\text {rd }}$ and $4^{\text {th }}$ dissociation steps can be disregarded. (1 pt) The following equations are thus true: $\begin{align*} & c=\left[\mathrm{H}_{4} \mathrm{~A}\right]+\left[\mathrm{H}_{3} \mathrm{~A}^{-}\right]+\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]=\left[\mathrm{H}^{+}\right]  \tag{1pt}\\ & {\left[\mathrm{H}^{+}\right]=\left[\mathrm{H}_{3} \mathrm{~A}^{-}\right]+2\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]} \tag{1pt} \end{align*}$ <br> This means that $\left[\mathrm{H}_{4} \mathrm{~A}\right]=\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right](1 \mathrm{pt})$ $K_{1} K_{2}=\frac{\left[\mathrm{H}^{+}\right]^{2}\left[\mathrm{H}_{2} \mathrm{~A}^{2-}\right]}{\left[\mathrm{H}_{4} \mathrm{~A}\right]}=\left[\mathrm{H}^{+}\right]^{2}\left(\text { or } \mathrm{pH}=\left(\mathrm{p} K_{1}+\mathrm{p} K_{2}\right) / 2=2.15\right)$ <br> pts) |
| :---: |

$C_{\text {EDTA: }}:$

## Problem 2

## $7 \%$ of the total

| Task 2 |
| :--- |
| 18 |
|  |

Determine the structure of the compounds A-H (stereochemistry is not expected), based on the information given in the following reaction scheme:

Hints:
A is a well-known aromatic hydrocarbon.
A hexane solution of $\mathbf{C}$ reacts with sodium (gas evolution can be observed), but $\mathbf{C}$ does not react with chromic acid.
${ }^{13} \mathrm{C}$ NMR spectroscopy shows that $\mathbf{D}$ and $\mathbf{E}$ contain only two kinds of $\mathrm{CH}_{2}$ groups.
When a solution of $\mathbf{E}$ is heated with sodium carbonate an unstable intermediate forms at first, which gives $F$ on dehydration.

Vinpocetine (Cavinton $®$, Calan $®$ ) is one of the best selling original drugs developed in Hungary. Its preparation relies on a natural precursor, (+)-vincamine $\left(\mathrm{C}_{21} \mathrm{H}_{26} \mathrm{~N}_{2} \mathrm{O}_{3}\right)$, which is isolated from the vine plant, vinca minor. The transformation of (+)-vincamine to vinpocetine is achieved in two steps depicted below.

Vincamine
All compounds ( $\mathbf{A}$ to $\mathbf{F}$ ) are enantiomerically pure compounds.
The elementary composition of $\mathbf{A}$ is: $\mathrm{C} 74.97 \%, \mathrm{H} 7.19 \%, \mathrm{~N} 8.33 \%$, $\mathrm{O} 9.55 \%$.
B has 3 other stereoisomers.
a) Propose structure for the intermediate $\mathbf{A}$ and vinpocetine (B).

A

B

B

A study of the metabolism of any drug forms a substantial part of its documentation. There are four major metabolites each formed from vinpocetine (B): C and $\mathbf{D}$ are formed in hydrolysis or hydration reactions, while $\mathbf{E}$ and $\mathbf{F}$ are oxidation products.

Hints:
The acidity of the metabolites decreases in the order C >> E >> D. F does not contain an acidic hydrogen.
$\mathbf{C}$ and $\mathbf{E}$ each have 3 other stereoisomers, while $\mathbf{D}$ and $\mathbf{F}$ each have 7 other stereoisomers.
$\mathbf{F}$ is a pentacyclic zwitterion and it has the same elementary analysis as $\mathbf{E}$ :
C 72.11\%, H 7.15\%, N 7.64\%, O 13.10\%.
The formation of $\mathbf{E}$ from $\mathbf{B}$ follows an electrophilic pattern.
The formation of $\mathbf{D}$ from $\mathbf{B}$ is both regio- and stereoselective.
b) Propose one possible structure for each of the metabolites C, D, E and F!
C

D

D ethyl vincaminate
Both stereoisomers around the new chiral center are acceptable.

E

F

All aromatic positions for the OH are acceptable in E.
c) Draw a resonance structure for $\mathbf{B}$ that explains the regioselective formation of $\mathbf{D}$ and the absence of the alternate regioisomer in particular.

|  |  |  |  |  |  |

A major transformation route for oxiranes (epoxides) is ring opening. This may be accomplished in various ways.

On acid catalysis the reactions proceed through cation-like (carbenium ion-like) species. For substituted oxiranes the direction of ring opening (which $\mathrm{C}-\mathrm{O}$ bond is cleaved) depends on the stability of the intermediate carbenium ion. The more stable the intermediate carbenium ion the more probable its formation. However, an open carbenium ion (with a planar structure) only forms if it is tertiary, benzylic or allylic.
On base catalysis the sterically less hindered $\mathrm{C}-\mathrm{O}$ bond is cleaved predominantly.
Keep stereochemistry in mind throughout the whole problem. To depict stereochemistry use only the - ..."IIlll - bond symbols and nothing else where necessary.
a) Draw the structure of the reactant and the predominant products when 2,2-dimethyloxirane (1,2-epoxy-2-methylpropane) reacts with methanol at low temperatures, catalysed by
(i) sulfuric acid
(ii) $\mathrm{NaOCH}_{3}$.

b) Draw the structure of the predominant product when the epoxide ring of the following leukotriene derivative is opened with a thiolate ( $\mathrm{RS}^{-}$).

Different porous acidic aluminosilicates can also be used to catalyse the transformation of alkyl oxiranes. In addition to ring opening, cyclic dimerisation is found to be the main reaction pathway producing mainly 1,4-dioxane derivatives (six-membered saturated rings with two oxygen atoms in positions 1,4).
c) Draw the structure(s) of the most probable 1,4-dioxane derivative(s) when the starting compound is (S)-2-methyloxirane ((S)-1,2-epoxypropane). Give the structure of the reactant as well.

(S)-2-methyloxirane

or

reactant 2 pts, product 2 pts, product stereochemistry 2 pts
d) Draw the structure(s) of the substituted 1,4-dioxane(s) when the epoxide reacting is $(R)$-1,2-epoxy-2-methylbutane ((R)-2-ethyl-2-methyloxirane). Give the structure of the reactant as well.
(R)-1,2-epoxy-2-methylbutane:

or

R,R

or

S,S

If two structures given for the R,S (meso) product: 1 pt
e) Give the structure(s) of the substituted 1,4-dioxane(s) when this reaction is carried out with racemic 1,2-epoxy-2-methylbutane (2-ethyl-2-methyloxirane).

## Problem 5

## $7 \%$ of the total

| 5 a | 5 b | Task 5 |
| :--- | :--- | :--- |
| 67 | 33 | 100 |
|  |  |  |

$A$ and $B$ are white crystalline substances. Both are highly soluble in water and can be moderately heated (up to $200^{\circ} \mathrm{C}$ ) without change but both decompose at higher temperatures. If an aqueous solution of $20.00 \mathrm{~g} \mathbf{A}$ (which is slightly basic, $\mathrm{pH} \approx 8.5-9$ ) is added to an aqueous solution of 11.52 g B (which is slightly acidic, $\mathrm{pH} \approx 4.5-5$ ) a white precipitate $\mathbf{C}$ forms that weighs 20.35 g after filtering, washing and drying. The filtrate is essentially neutral and gives a brown colour reaction with an acidified KI solution. When boiled, the filtrate evaporates without the appearance of any residue.
The white solid $\mathbf{D}$ can be prepared by the heating of $\mathbf{A}$ in the absence of air. The exothermic reaction of $\mathbf{D}$ with water gives a colourless solution. This solution, if kept in an open container, slowly precipitates a white solid E and leaves water. Upon prolonged exposure to air at room temperature, solid $\mathbf{D}$ is transformed into $\mathbf{E}$ as well. However, heating $\mathbf{D}$ in air at $500^{\circ} \mathrm{C}$ produces a different white substance $\mathbf{F}$, which is barely soluble in water and has a mass of only $85.8 \%$ of the $\mathbf{E}$ formed from the same amount of $\mathbf{D} . \mathbf{F}$ gives a brown colour reaction with an acidified solution of KI.

E can be converted back into $\mathbf{D}$ but ignition above $1400^{\circ} \mathrm{C}$ is required for this purpose. The reaction of $\mathbf{B}$ and $\mathbf{D}$ in water forms the precipitate $\mathbf{C}$ and is accompanied by a characteristic odour.
a) Give the formulae of the substances A-F

| $\mathbf{A}$ | $\mathrm{Ba}\left(\mathrm{NO}_{2}\right)_{2}$ | 8 pts | $\mathbf{B}$ | $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$ | 8 pts | $\mathbf{C}_{\mathrm{BaSO}_{4}}$ | 4 pts | 25 bonus points if <br> both $\mathbf{A}$ and $\mathbf{B}$ are <br> identified correctly. |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{D}$ | BaO | 4 pts | $\mathbf{E}$ | $\mathrm{BaCO}_{3}$ | 4 pts | $\mathbf{F}_{\mathrm{BaO}_{2}}$ | 14 pts |  |

b) Write balanced equations for all the reactions mentioned. (The equation for the thermal decomposition of $\mathbf{B}$ is not required.)

Equations:
Suggestions for the treatment of some errors:
If the student chooses Ca or Sr for the cation in $\mathbf{A}$, the solution may be qualitatively partly correct but it contradicts the stoichiometric data. In this case the student loses the points for the Ba containing species but gets full points for all otherwise correct equations, with the obvious exception of the peroxide formation. The choice of any other metal nullifies the points for all formulae and equations featuring the metal. The choice of $\mathrm{HPO}_{4}{ }^{2-}$ for the anion of B is treated similarly. Minor errors in the equations (charges, coefficients etc.) will be penalized with 1 p each (but obviously no negative score for any item).

## Detailed solution:

The problem contains quite a number of clues to the identification of the compounds. It is clear that A, D, E, and F all contain the same element; with a water-soluble solid compound stable at $1400{ }^{\circ} \mathrm{C}$, probably a metal. The aqueous solution of a metal compound giving a precipitate and pure water upon standing in the air strongly hints at the formation of a carbonate, possibly from a soluble hydroxide. A likely conclusion is that $\mathbf{D}$ is an oxide, limiting the choice of the metal to Sr or Ba . (One might also consider Li, Ca, or TI which are less satisfactory because $\mathrm{Ca}(\mathrm{OH})_{2}$ is poorly soluble while the solubilities of $\mathrm{Li}_{2} \mathrm{CO}_{3}$ and $\mathrm{Tl}_{2} \mathrm{CO}_{3}$ are quite significant.) If E is an alkaline earth metal carbonate, then the molar mass of $F$ could be either $M_{\mathrm{Ca}}+45.8$, or $M_{\mathrm{sr}}+$ 39.05 , or $M_{\mathrm{Ba}}+32$. Since $F$ is formed by heating the oxide in air, the former two do not make any sense while the latter is consistent with $\mathrm{BaO}_{2}$. This is confirmed by the oxidative capability of $F$.
The odour appearing in the reaction of $\mathbf{B}$ with $\mathrm{Ba}(\mathrm{OH})_{2}$ indicates that the former might be an ammonium salt. Assuming that the reaction of $\mathbf{A}$ and $\mathbf{B}$ is a simple precipitation between a barium salt and an ammonium salt, we get an equivalent mass of 48 for the anion of the precipitate. This might be either $\mathrm{SO}_{4}{ }^{2-}$ or $\mathrm{HPO}_{4}{ }^{2-}$ but the acidity of $\mathbf{B}$ is consistent with the former and, in addition, $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{HPO}_{4}$ would not give the same $\mathrm{BaHPO}_{4}$ precipitate with $\mathrm{Ba}(\mathrm{OH})_{2}$ as with $\mathrm{Ba}\left(\mathrm{NO}_{2}\right)_{2}$. If we accept that B is $\left(\mathrm{NH}_{4}\right)_{2} \mathrm{SO}_{4}$, we obtain an equivalent mass of 46 for the anion of $\mathbf{A}$. This and the surrounding chemistry are consistent with the nitrite ion.

## Problem 6

|  |  |  |  |  |  |  |  |

A feathery, greenish solid precipitate can be observed if chlorine gas is bubbled into water close to its freezing point. Similar precipitates form with other gases such as methane and noble gases. These materials are interesting because vast quantities of the so-called methane-hydrates are supposed to exist in nature (comparable in quantity with other natural gas deposits).
These precipitates all have related structures. The molecules of water just above its freezing point form a hydrogen-bonded structure. The gas molecules stabilize this framework by filling in the rather large cavities in the water structure forming clathrates.
The crystals of chlorine and methane clathrates have the same structure. Their main characteristics are dodecahedra formed from 20 water molecules. The unit cell of the crystal can be thought as a body-centered cubic arrangement built from these dodecahedra which are almost spherical objects. The dodecahedra are connected via additional water molecules located on the faces of the unit cell. Two water molecules can be found on each face of the unit cell. The unit cell has an edge dimension of 1.182 nm .

There are two types of cavities in this structure. One is the internal space in the dodecahedra (A). These are somewhat smaller than the other type of voids (B), of which there are 6 for each unit cell.
a) How many type $\mathbf{A}$ cavities can be found in a unit cell?

2
b) How many water molecules are there in a unit cell?
$46=20 \times 2$ (dodecahedra) $+6 \times 2 / 2$ (faces)
c) If all cavities contain a guest molecule, what is the ratio of the number of water to the number of guest molecules?

$$
46: 8=5.75
$$

d) Methane hydrate is formed with the structure in c) at temperatures between $0-10{ }^{\circ} \mathrm{C}$. What is the density of the clathrate?

```
A unit cell has a volume of 1.182 nm}\mp@subsup{}{}{3}=1.651 nm2. 2 pt
It contains 8 methane and 46 water molecules with a mass of 957 g mol
1.589\cdot10-21 g. 2 pt
```

The density is $1.589 / 1.651=0.962 \mathrm{~g} / \mathrm{cm}^{3} . \quad 2 \mathrm{pt}$

Density:
e) The density of chlorine hydrate is $1.26 \mathrm{~g} / \mathrm{cm}^{3}$. What is the ratio of the number of water and guest molecules in the crystal?

The mass of a unit cell with this density is: $1.651 \mathrm{~nm}^{3} \cdot 1.26 \mathrm{~g} / \mathrm{cm}^{3}=2.081 \cdot 10^{-21} \mathrm{~g}$, meaning $1253 \mathrm{~g} / \mathrm{mol}$ for the contents.
Substracting the waters, this means $424.3 \mathrm{~g} / \mathrm{mol}$ for the chlorine atoms, giving
11.97 chlorine atoms in a unit cell. 2 pts

The ratio is then $6(5.98)$ chlorine molecules for the 46 waters, or a ratio of 7.68 .
1 pts
It is expected that only the 6 larger B type cavities contain chlorine. 3 pts

Ratio:
Which cavities are likely to be filled in a perfect chlorine hydrate crystal? Mark one or more.

Some ASome B $\square$ All A
$\square$ All B
Covalent radii reflect atomic distances when the atoms are covalently bonded. Nonbonded or van der Waals radii give a measure of the atomic size when they are not bonded covalently (modeled as hard spheres).

| Atom | Covalent radius (pm) | Nonbonded radius (pm) |
| :---: | :---: | :---: |
| H | 37 | 120 |
| C | 77 | 185 |
| O | 73 | 140 |
| Cl | 99 | 180 |

f) Based on the covalent and nonbonded radii of these atoms estimate lower and upper bounds for the average radii of the cavities where possible. Show your reasoning.

Methane fits in both cavities, its radius is appr. $37+77+120 \mathrm{pm}=234 \mathrm{pm} . \quad 3 \mathrm{pts}$ The chlorine molecule, with a radius of $180+99 \mathrm{pm}=279 \mathrm{pm}$, fits only in B. 3 pts Thus $234 \mathrm{pm}<r(\mathbf{A})<279 \mathrm{pm}$ and $279 \mathrm{pm}<r(\mathbf{B})$

$$
2 \text { pts } 2 \text { pts } \quad 2 \text { pts }
$$

$$
<r(\mathbf{A})<\quad<r(\mathbf{B})
$$

Let us consider the following processes

$$
\begin{align*}
& \mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{H}_{2} \mathrm{O}(\mathrm{~s})  \tag{1}\\
& \mathrm{x} \mathrm{CH} 44(\mathrm{~g})+\mathrm{H}_{2} \mathrm{O}(\mathrm{I}) \rightarrow \mathrm{xCH}_{4} \cdot 1 \mathrm{H}_{2} \mathrm{O} \text { (clathrate) } \tag{2}
\end{align*}
$$

g) What are the signs of the following molar quantities referring to these reactions in the given direction at $4{ }^{\circ} \mathrm{C}$ ? Mark with a -, 0 or + .

|  | sign |
| :--- | :--- |
| $\Delta G_{m}(1)$ |  |
| $\Delta G_{m}(2)$ |  |
| $\Delta H_{m}(1)$ |  |
| $\Delta H_{m}(2)$ |  |
| $\Delta S_{m}(1)$ |  |
| $\Delta S_{m}(2)$ |  |
| $\Delta S_{m}(2)-\Delta S_{m}(1)$ |  |
| $\Delta H_{m}(2)-\Delta H_{m}(1)$ |  |

```
+, -, -, -, -, -, -, -,
Under these conditions, methane clathrate
forms, while ice melts to water, so the Gibbs
energy changes are of opposite signs.
Freezing is an exothermic process with an
entropy decrease in both cases.
The entropy decrease of the clathrate
formation is larger in magnitude, as it
involves a gas-solid transition.
The relation of the reaction enthalpies can be
inferred from these facts:
```

```
T(\Delta\mp@subsup{S}{m}{\prime}(2)-\Delta\mp@subsup{S}{m}{\prime}(1))>\Delta\mp@subsup{H}{m}{\prime}(2)-\Delta\mp@subsup{H}{m}{\prime}(1)
a negative quantity >\DeltaHm(2) -\DeltaHm(1)
1 pt each, the last 3 pts.
```

## Problem 7

## $8 \%$ of the total

| 7 a | 7 b | 7 c | 7 d | 7 e | 7 f | 7 g | 7 h | Task 7 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 2 | 1 | 4 | 2 | 8 | 5 | 8 | 12 | 42 |
|  |  |  |  |  |  |  |  |  |

The dithionate ion $\left(\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}\right)$ is a rather inert inorganic ion. It can be prepared by bubbling sulphur-dioxide continously into ice-cooled water to which manganese dioxide is added in small increments. Dithionate and sulphate ions are formed under these circumstances.
a) Write the balanced chemical equations for the two reactions.

$$
\begin{aligned}
& \mathrm{MnO}_{2}+2 \mathrm{SO}_{2} \rightarrow \mathrm{Mn}^{2+}+\mathrm{S}_{2} \mathrm{O}_{6}^{2-} \\
& \mathrm{MnO}_{2}+\mathrm{SO}_{2} \rightarrow \mathrm{Mn}^{2+}+\mathrm{SO}_{4}^{2-} \quad 1 \text { pt each }
\end{aligned}
$$

After the reaction is complete, $\mathrm{Ba}(\mathrm{OH})_{2}$ is added to the mixture until the sulphate ions are fully precipitated. This is followed by the addition of $\mathrm{Na}_{2} \mathrm{CO}_{3}$.
b) Write the balanced equation for the reaction that takes place upon addition of $\mathrm{Na}_{2} \mathrm{CO}_{3}$.

$$
\mathrm{MnS}_{2} \mathrm{O}_{6}+\mathrm{Na}_{2} \mathrm{CO}_{3} \rightarrow \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}+\underline{\mathrm{MnCO}_{3}} \quad 1 \mathrm{pt}
$$

Sodium dithionate is then crystallized by evaporating some of the solvent. The prepared crystals dissolve readily in water and do not give a precipitate with $\mathrm{BaCl}_{2}$ solution. When the solid is heated and maintained at $130^{\circ} \mathrm{C}$, $14.88 \%$ weight loss is observed. The resulting white powder dissolves in water and does not give a precipitate with $\mathrm{BaCl}_{2}$ solution. When another sample of the original crystals is kept at $300^{\circ} \mathrm{C}$ for a few hours, 41.34 \% weight loss occurs. The resulting white powder dissolves in water and gives a white precipitate with $\mathrm{BaCl}_{2}$ solution.
c) Give the composition of the prepared crystals and write balanced equations for the two processes that occur during heating.

## Formula:

Equation ( $130^{\circ} \mathrm{C}$ ):

$$
\begin{aligned}
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O} \quad(2 \mathrm{pts} \text { only for the correct formula) } \\
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \cdot 2 \mathrm{H}_{2} \mathrm{O} \rightarrow \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}+2 \mathrm{H}_{2} \mathrm{O}(1 \mathrm{pt}) \\
& \mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6} \rightarrow \mathrm{Na}_{2} \mathrm{SO}_{4}+\mathrm{SO}_{2} \text { or with } \mathrm{H}_{2} \mathrm{O}(1 \mathrm{pt})
\end{aligned}
$$

Equation $\left(300^{\circ} \mathrm{C}\right)$ :

Although dithionate ion is a fairly good reducing agent thermodynamically, it does not react with oxidants in solution at room temperature. At $75{ }^{\circ} \mathrm{C}$, however, it can be oxidized in acidic solutions. A series of kinetic experiments were carried out with bromine as an oxidant.
d) Write the balanced chemical equation for the reaction between bromine and dithionate ion.

$$
\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{Br}_{2}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{SO}_{4}{ }^{2-}+2 \mathrm{Br}^{-}+4 \mathrm{H}^{+} \quad 2 \mathrm{pts}
$$

The initial rates $\left(v_{0}\right)$ of the reaction were determined in a number of experiments at $75^{\circ} \mathrm{C}$.
$\left.\begin{array}{|c|c|c|c|}\hline \begin{array}{c}{\left[\mathrm{Br}_{2}\right]_{0}} \\ \left(\mathrm{mmol} / \mathrm{dm}^{3}\right)\end{array} & \begin{array}{c}{\left[\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}\right]_{0}} \\ \left(\mathrm{~mol} / \mathrm{dm}^{3}\right)\end{array} & \begin{array}{c}{\left[\mathrm{H}^{+}\right]_{0}} \\ \left(\mathrm{~mol} / \mathrm{dm}^{3}\right)\end{array} & \left.\begin{array}{c}v_{0} \\ (\mathrm{nmol} \mathrm{dm}\end{array} \mathrm{s}^{-1}\right)\end{array}\right]$
e) Determine the order of the reaction with respect to $\mathrm{Br}_{2}, \mathrm{H}^{+}$and $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}$, the experimental rate equation, and the value and unit of the rate constant.

| Reaction order for $\mathrm{Br}_{2}$ : | for $\mathrm{H}^{+}$: for $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}$ : |
| :---: | :---: |
| Experimental rate equation: | $\begin{array}{ccc} 0 & 1 & 1 \end{array}$ |
|  | $v=k\left[\mathrm{~S}_{2} \mathrm{O}_{6}{ }^{2-}\right]\left[\mathrm{H}^{+}\right] \quad(1 \mathrm{pt})$ |
|  | $k=2.56 \cdot 10^{-5} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1} \quad$ (1 pt: no point if unit is incorrect; unorthodox but correct unit acceptable) |
| $k$ : |  |

In similar experiments, chlorine, bromate ion, hydrogen peroxide and chromate ion have all been used as oxidizing agents at $75{ }^{\circ} \mathrm{C}$. The rate equations for these processes are analogous to the one observed with bromine, the units of all rate constants are the same, the values are $2.53 \cdot 10^{-5}\left(\mathrm{Cl}_{2}\right), 2.60 \cdot 10^{-5}\left(\mathrm{BrO}_{3}^{-}\right), 2.56 \cdot 10^{-5}\left(\mathrm{H}_{2} \mathrm{O}_{2}\right)$, and $2.54 \cdot 10^{-5}\left(\mathrm{Cr}_{2} \mathrm{O}_{7}{ }^{2-}\right)$.
Experiments were also carried out in acidic sodium dithionate solution without any oxidizing agent. When following the processes by UV spectrophotometry, the slow appearance of a new absorption band around 275 nm was observed. Although hydrogen sulphate ion is a detectable product of the reaction, it does not absorb any light above 200 nm .
f) Give the formula of the major species causing the new absorption band and write the balanced equation of the chemical reaction occurring in the absence of oxidants.

| Species: | $\mathrm{SO}_{2}\left(\right.$ or $\left.\mathrm{H}_{2} \mathrm{SO}_{3}\right) \quad 3 \mathrm{pts}$ (2 pt for $\mathrm{HSO}_{3}{ }^{-}$or $\mathrm{SO}_{3}{ }^{2-}$ ) |
| :--- | :--- |
| Reaction: | $\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{HSO}_{4}{ }^{-}+\mathrm{SO}_{2} \quad$ 2pts (if sulfur(IV) product is different but <br> consistent with the previous answer also 2 pts) |
|  |  |

An experiment was carried out to follow the absorbance at 275 nm with initial concentrations: $\left[\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}\right]=0.0022 \mathrm{~mol} / \mathrm{dm}^{3},\left[\mathrm{HClO}_{4}\right]=0.70 \mathrm{~mol} / \mathrm{dm}^{3}$, and the temperature was $75^{\circ} \mathrm{C}$. A pseudo first-order kinetic curve was found with a half-life of 10 hours and 45 minutes.
g) Calculate the rate constant of the reaction.

| $t_{1 / 2}=10 \mathrm{~h} 45 \mathrm{~min}=3.87 \cdot 10^{4} \mathrm{~s}$ <br> $k_{\text {obs }}=\ln 2 / \mathrm{t}_{1 / 2}=1.79 \cdot 10^{-5} \mathrm{~s}^{-1}$ <br> $k=k_{\text {obs }} /\left[\mathrm{H}^{+}\right]=2.56 \cdot 10^{-5} \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~s}^{-1}$ <br> units also acceptable) 2 pts <br> 2 pts (other consistent <br> $k:$  |
| :--- | :--- |

Suggest a balanced chemical equation for the rate determining step of the reactions that used an oxidizing agent.

Rate determining step:

$$
\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+\mathrm{H}^{+} \rightarrow \mathrm{HSO}_{4}^{-}+\mathrm{SO}_{2} 4 \text { pts }
$$

When periodate ion (which is present as $\mathrm{H}_{4} \mathrm{IO}_{6}^{-}$in aqueous solution) was used as an oxidant for dithionate ion, the two kinetic curves depicted in the graph were detected at $75^{\circ} \mathrm{C}$ in the same experiment at two different wavelengths. The initial concentrations were $\left[\mathrm{H}_{4} \mathrm{IO}_{6}{ }^{-}\right]=5.3 \cdot 10^{-4} \mathrm{~mol} / \mathrm{dm}^{3},\left[\mathrm{Na}_{2} \mathrm{~S}_{2} \mathrm{O}_{6}\right]=0.0519 \mathrm{~mol} / \mathrm{dm}^{3},\left[\mathrm{HClO}_{4}\right]=0.728 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{At}$ 465 nm , only $\mathrm{I}_{2}$ absorbs and its molar absorption coefficient is $715 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$. At 350 nm , only $\mathrm{I}_{3}{ }^{-}$absorbs and its molar absorption coefficient is $11000 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}$. The optical path length was 0.874 cm .

h) Write balanced chemical equations for the reactions that occur in the region where the absorbance increases at 465 nm , and in the region where the absorbance decreases at 465 nm .

| Increase: | $2 \mathrm{H}_{4} \mathrm{IO}_{6}^{-}+7 \mathrm{~S}_{2} \mathrm{O}_{6}{ }^{2-}+2 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{H}^{+} \rightarrow 14 \mathrm{HSO}_{4}^{-}+\mathrm{I}_{2}$ |
| :--- | :--- |
| Decrease: $\quad 2 \mathrm{pts}$ |  |
| $\mathrm{I}_{2}+\mathrm{S}_{2} \mathrm{O}_{6}{ }^{2-}+2 \mathrm{H}_{2} \mathrm{O} \rightarrow 2 \mathrm{HSO}_{4}^{-}+2 \mathrm{I}^{-}+2 \mathrm{H}^{+} \quad 2 \mathrm{pts}$ |  |

Calculate the expected time for the maximum absorbance of the kinetic curve measured at 465 nm .

$$
t_{\max }=\frac{7}{2} \frac{\left[\mathrm{H}_{4} \mathrm{IO}_{6}^{-}\right]_{0}}{k\left[\mathrm{~S}_{2} \mathrm{O}_{6}{ }^{2-}\right]_{0}\left[\mathrm{H}^{+}\right]_{0}}=\frac{7 \times 5.3 \times 10^{-4} \mathrm{M}}{2 \times 2.56 \times 10^{-5} \mathrm{M}^{-1} \mathrm{~s}^{-1} \times 0.0519 \mathrm{M} \times 0.728 \mathrm{M}}=1900 \mathrm{~s}
$$

5 pts
$t_{\text {max }}$ :
Estimate the expected ratio of the slopes of the increasing and decreasing regions in the kinetic curve measured at 465 nm
slope ratio: 1: -7 (it reflects the stoichiometry) 3 pts

Slope ratio:

## Problem 8

## $7 \%$ of the total

| 8a | 8 b | 8 c | 8 d | 8 e | 8 f | 8 g | 8 h | 8 i | Task 8 |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| 3 | 3 | 4 | 2 | 3 | 2 | 7 | 3 | 5 | 32 |
|  |  |  |  |  |  |  |  |  |  |

Ms. Z was a bright student, whose research project was to measure the complexation of all lanthanide(III) ions with newly designed complexing ligands. One day she monitored the UV-vis absorption with Ce (III) and a particularly poor complexing ligand in a spectrophotometer. She noticed that some small bubbles had formed in the closed cell by the end of the 12 -hour experiment. Soon she realized that the presence of the ligand is not necessary to see the bubble formation, and continued her experiments with an acidified $\mathrm{CeCl}_{3}$ solution. Bubble formation never occurred when she just kept the solution in the spectrophotometer without turning on the instrument. Next, Ms. Z used a small quartz flask, in which she dipped a chloride ion selective electrode and could also withdraw samples regularly for spectrophotometric measurements. She calibrated the chloride ion selective electrode using two different NaCl solutions and obtained the following results:

| $c_{\mathrm{NaCl}}\left(\mathrm{mol} / \mathrm{dm}^{3}\right)$ | $E(\mathrm{mV})$ |
| :--- | :--- |
| 0.1000 | 26.9 |
| 1.000 | -32.2 |

a) Give a formula to calculate the chloride ion concentration of an unknown sample based on the electrode voltage reading ( $E$ ).

$$
\left[\mathrm{Cl}^{-}\right]=\quad\left[\mathrm{Cl}^{-}\right]=10^{-(E+32.2 m \mathrm{~V}) / 59.1 m \mathrm{~V}}
$$

Ms. $Z$ also determined the molar absorption coefficient for $\mathrm{Ce}^{3+}\left(\varepsilon=35.2 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$ at 295 nm , and, as a precaution, also for $\mathrm{Ce}^{4+}\left(\varepsilon=3967 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$.
b) Give a formula to calculate the $\mathrm{Ce}^{3+}$ concentration from an absorbance reading at $295 \mathrm{~nm}(A)$ measured in a solution containing $\mathrm{CeCl}_{3}$ (cuvette path length: 1.000 cm ).

$$
\left[\mathrm{Ce}^{3+}\right]=\left[\mathrm{Ce}^{3+}\right]=\frac{A_{295 n m}}{35.2 \mathrm{dm}^{3} \mathrm{~mol}^{-1}}
$$

Ms. Z prepared a solution which contained $0.0100 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{CeCl}_{3}$ and $0.1050 \mathrm{~mol} / \mathrm{dm}^{3}$ HCl , and began her experiment by turning on a quartz lamp. HCl does not absorb at 295 nm .
c) What were the expected initial absorbance and voltage readings?

$A_{295 \mathrm{~nm}}=$| $\left[\mathrm{Ce}^{3+}\right]=0.0100 \mathrm{~mol} / \mathrm{dm}^{3} \Rightarrow A_{295 \mathrm{~nm}}=0.352$ |
| :--- |
| $\left[\mathrm{Cl}^{-}\right]=3.0 .0100 \mathrm{~mol} / \mathrm{dm}^{3}+0.1050 \mathrm{~mol} / \mathrm{dm}^{3}=0.1350 \mathrm{~mol} / \mathrm{dm}^{3} \Rightarrow E=19.2 \mathrm{mV}$ |

Before the quantitative experiment Ms. Z collected the gas formed into a carefully neutralized solution of methyl orange (acid-base and redox indicator). Although she saw bubbles going through the solution, the colour did not change or fade even after a day.
d) Give the formula of two gases, comprised of elements in the illuminated sample, which could not be present given the results of this experiment.

$$
\mathrm{HCl}, \mathrm{Cl}_{2},\left(\mathrm{O}_{3}, \mathrm{ClO}_{2}\right) \text { (no oxidation of indicator) }
$$

During her quantitative experiment she recorded the absorbance and voltage values regularly. The uncertainty of the spectophotometric measurements is $\pm 0.002$ and the accuracy of the voltage measurements is $\pm 0.3 \mathrm{mV}$.

| time (min) | 0 | 120 | 240 | 360 | 480 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| $A_{295 \mathrm{~nm}}$ | 0.3496 | 0.3488 | 0.3504 | 0.3489 | 0.3499 |
| $E(\mathrm{mV})$ | 19.0 | 18.8 | 18.8 | 19.1 | 19.2 |

e) Estimate the average rate of change in the concentrations of $\mathrm{Ce}^{3+}, \mathrm{Cl}^{-}$, and $\mathrm{H}^{+}$.
$\mathrm{d}\left[\mathrm{Ce}^{3+}\right] / \mathrm{d} t=$
$\mathrm{d}\left[\mathrm{Cl}^{-}\right] / \mathrm{d} t=$
$\mathrm{d}\left[\mathrm{H}^{+}\right] / \mathrm{d} t=$

No significant change in either $\mathrm{Cl}^{-}$or $\mathrm{Ce}^{3+}$ concentrations. $\left[\mathrm{H}^{+}\right]=\left[\mathrm{Cl}^{-}\right]-3\left[\mathrm{Ce}^{3+}\right]$, no significant change.
All three values zero. 1 pt each.

The following day, Ms. Z used an intense monochromatic light beam ( 254 nm ) with an intensity of 0.0500 W . She passed this light through a $5-\mathrm{cm}$ long quartz photoreactor filled with the same acidic $\mathrm{CeCl}_{3}$ solution she had used before. She measured the molar absorption coefficient for $\mathrm{Ce}^{3+}\left(\varepsilon=2400 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1}\right)$ at 254 nm .
f) What percentage of the light is absorbed in this experimental setup?

$$
A=2400 \mathrm{dm}^{3} \mathrm{~mol}^{-1} \mathrm{~cm}^{-1} \cdot 5 \mathrm{~cm} \cdot 0.0100 \mathrm{M}=120 \Rightarrow\left(100-10^{-118}\right) \% \approx 100 \%
$$

The equipment allowed her to lead the gas first through a drying tube that removed traces of water vapour and then into a closed chamber, whose volume was $68 \mathrm{~cm}^{3}$. The chamber was equipped with a high-precision manometer and an igniter. She first filled the chamber with dry argon to a pressure of 102165 Pa and then she turned on the lamp. In 18.00 hours, the pressure reached 114075 Pa . The temperature of the equipment was $22.0^{\circ} \mathrm{C}$.
g) Estimate the amount of substance of the gas collected in the chamber.

```
p
n= p
2 pts
```

$n_{\text {gas: }}$
At this point, Ms. Z turned off the light and pressed the ignition button. When the chamber cooled down to the initial temperature, the final pressure was 104740 Pa.

Suggest the formula(s) of the gas(es) formed and collected, and give the balanced equation for the original chemical reaction taking place under illumination.

| Gas(es):identity of gases: $\mathrm{H}_{2}, \mathrm{O}_{2} 4 \mathrm{pts}$ <br> reaction: $2 \mathrm{H}_{2} \mathrm{O} \xrightarrow{\mathrm{hv}} 2 \mathrm{H}_{2}+\mathrm{O}_{2} 1 \mathrm{pt}$ |
| :--- | :--- |
| Reaction: |

h) What would be the final pressure after the ignition if the chamber was being filled for 24 hours before ignition?

i) Estimate the quantum yield of product formation in the Ce (III) solution.

Quantum yield:
$3.3 \cdot 10^{-4} \mathrm{~mol}$ gas formed altogether: $2.2 \cdot 10^{-4} \mathrm{~mol} \mathrm{H}_{2}$ and $1.1 \cdot 10^{-4} \mathrm{~mol} \mathrm{O}_{2}$.
Light beam intensity $0.0500 \mathrm{Js}^{-1} \Rightarrow \frac{0.0500 \mathrm{~J} / \mathrm{s} \lambda}{h c N_{A}}=1.06 \cdot 10^{-7} \mathrm{mols}^{-1}$ photon Total time $18.00 \mathrm{~h}=64800 \mathrm{~s}$
Total number of absorbed photons: $64800 \mathrm{~s} \cdot 1.06 \cdot 10^{-7} \mathrm{mols}^{-1}=6.87 \cdot 10^{-3} \mathrm{~mol}$
Quantum yield for $\mathrm{H}_{2}$ production: $\Phi=2.2 \cdot 10^{-4} \mathrm{~mol} / 6.87 \cdot 10^{-3} \mathrm{~mol}=0.032$
Quantum yield for $\mathrm{O}_{2}$ production: $\Phi=1.1 \cdot 10^{-4} \mathrm{~mol} / 6.87 \cdot 10^{-3} \mathrm{~mol}=0.016$
Either value or the quantum yield of the gas production (0.048) is acceptable when demonstrated in a calculation.

Quantum yield:

## Problem 9

## $6 \%$ of the total

| 9 a | 9 b | 9 c | 9 d | Task 9 |
| :--- | :--- | :--- | :--- | :--- |
| 12 | 21 | 15 | 9 | 57 |
|  |  |  |  |  |

Thallium exists in two different oxidation states: $\mathrm{Tl}^{+}$and $\mathrm{Tl}^{3+}$. lodide ions can combine with iodine to form tri-iodide ions $\left(\mathrm{I}_{3}{ }^{-}\right)$in aquous solutions,
The standard redox potentials for some relevant reactions are:

$$
\begin{array}{ll}
\mathrm{Tl}^{+}(\mathrm{aq})+\mathrm{e}^{-} \rightarrow \mathrm{Tl}(\mathrm{~s}) & \mathrm{E}_{1}=-0.336 \mathrm{~V} \\
\mathrm{Tl}^{3+}(\mathrm{aq})+3 \mathrm{e}^{-} \rightarrow \mathrm{Tl}(\mathrm{~s}) & E_{2}{ }_{2}=+0.728 \mathrm{~V}
\end{array}
$$

$$
\mathrm{I}_{2}(\mathrm{~s})+2 \mathrm{e}^{-} \square 2 \mathrm{I}^{-}(\mathrm{aq}) E_{3}^{\prime}=+0.540 \mathrm{~V}
$$

The equilibrium constant for the reaction $\mathrm{I}_{2}(\mathrm{~s})+\mathrm{I}^{-}(\mathrm{aq}) \rightarrow \mathrm{I}_{3}{ }^{-}(\mathrm{aq}): K_{1}=0.459$.
Use $T=25^{\circ} \mathrm{C}$ throughout this problem.
a) Calculate the redox potential for the following reactions:

$$
\mathrm{Tl}^{3+}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow \mathrm{Tl}^{+}(\mathrm{aq}) \quad E_{4}^{\circ}
$$

$$
E_{4}^{\circ}=\frac{3 E_{2}^{\circ}-E_{1}^{\circ}}{2}=1.26 \mathrm{~V} \quad 6 \mathrm{pts}
$$

$E^{0}{ }_{4}=$

$$
\mathrm{I}_{3}^{-}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{I}^{-}(\mathrm{aq}) \quad E_{5}^{{ }_{5}}
$$

$$
E_{5}^{o_{5}}=E_{3}^{\circ}+0.059 / 2 \lg \left(1 / K_{1}\right)=0.550 \mathrm{~V} 6 \text { pts }
$$

$E_{5}^{\circ}=$
b) Write empirical formulae for all theoretically possible neutral compounds that contain one thallium ion and any number of iodide and/or tri-iodide ion(s) as anion(s).

Tll, $\mathrm{Tll}_{3}, \mathrm{Tll}_{5}, \mathrm{Tll}_{7}, \mathrm{Tll}_{9} \quad 1$ pt each

There is an empirical formula that could belong to two different compounds. Which one?

```
Tll}\mp@subsup{3}{3}{}\mathrm{ can be either Tl }\mp@subsup{}{}{3+}(\mp@subsup{\textrm{I}}{}{-}\mp@subsup{)}{3}{}\mathrm{ or Tl }\mp@subsup{\textrm{I}}{}{+}(\mp@subsup{\textrm{I}}{3}{-}) 4 pts
```

Based on the standard redox potentials, which of the two isomers mentioned above is the stable one at standard conditions? Write the chemical reaction for the isomerisation of the other isomer of thallium iodide.

| M | $\mathrm{Tl}^{+}\left(\mathrm{I}_{3}^{-}\right)$ <br> as $E^{0}{ }_{4}>E_{5}^{\circ}$ or $E^{\circ}{ }_{3}$, |
| :---: | :---: |
| Isomerisation: | $\begin{aligned} & \mathrm{Tl}^{3+}+3 \mathrm{l}^{-}=\mathrm{Tl}^{+}+\mathrm{I}_{3}^{-} \quad 6 \text { pts } \\ & 3 \text { pts for } \mathrm{Tll}_{3}=\mathrm{Tl}\left(\mathrm{I}_{3}\right) ; 0 \text { pts for } \mathrm{Tl}^{3+}+3 \mathrm{I}^{-}=\mathrm{Tl}^{+}+\mathrm{I}_{2} \end{aligned}$ |

Complex formation can shift this equilibrium. The cumulative complex formation constant for the reaction $\mathrm{Tl}^{3+}+4 \mathrm{I}^{-} \rightarrow \mathrm{TlI}_{4}^{-}$is $\beta_{4}=10^{35.7}$
c) Write the reaction that takes place when a solution of the more stable isomer of thallium iodide is treated with an excess of KI. Calculate the equilibrium constant for this reaction.

| Reaction | $\mathrm{Tl}^{+}+\mathrm{I}_{3}^{-}+\mathrm{I}^{-} \rightarrow \mathrm{Tll}_{4}^{-} \quad 3 \mathrm{pts}$ <br> This reaction could be regarded as sum of three reactions: $\mathrm{Tl}^{+}(\mathrm{aq}) \rightarrow \mathrm{Tl}^{3+}(\mathrm{aq})+2 \mathrm{e}^{-} \quad-E^{\circ}{ }_{4}=-1.26 \mathrm{~V}$, thus $\Delta_{\mathrm{r}} \mathrm{G}_{4}{ }^{\circ}=n F E_{4}{ }^{\circ}=243.1 \mathrm{~kJ} / \mathrm{mol}$ $\mathrm{I}_{3}{ }^{-}(\mathrm{aq})+2 \mathrm{e}^{-} \rightarrow 3 \mathrm{I}^{-}(\mathrm{aq}) \quad E_{5}^{0_{5}}=0.550 \mathrm{~V}$, thus $\Delta_{\mathrm{r}} \mathrm{G}_{5}{ }^{\circ}=-n F E_{5}{ }^{\circ}=-106.1 \mathrm{~kJ} / \mathrm{mol}$ $\mathrm{Tl}^{3+}+4 \mathrm{I}^{-} \rightarrow \mathrm{Tll}_{4}^{-} \quad \beta_{4}=10^{35.7}$ thus $\Delta_{\mathrm{r}} \mathrm{G}_{6}{ }^{\circ}=-R T \ln \beta_{4}=-203.8 \mathrm{~kJ} / \mathrm{mol}$ <br> The net free enthalpy change is $\Delta_{\mathrm{r}} \mathrm{G}_{7}{ }^{0}=\Delta_{\mathrm{r}} \mathrm{G}_{4}{ }^{\circ}+\Delta_{\mathrm{r}} G_{5}{ }^{\circ}+\Delta_{\mathrm{r}} G_{6}{ }^{\circ}=-66.8 \mathrm{~kJ} / \mathrm{mol}$ Thus $K_{2}=\exp \left(-\frac{\Delta_{r} G_{7}}{R T}\right)=4.96 \cdot 10^{11}$ <br> 3 pts each for $\Delta_{r} G^{\circ}(4-6)$ and for $K_{2}$. |
| :---: | :---: |
| $K_{2}$ : |  |

If the solution of the more stable isomer is treated with a strong basic reagent precipitation of a black substance can be observed. After the water content of the precipitate is removed, the remaining material contains $89.5 \%$ thallium (by mass).
d) What is the empirical formula of this compound? Show your calculations. Write a balanced equation for its formation.

Supposing that the substance contains Tl and an anion, the formula of the compound is $\mathrm{Tl}_{a} \mathrm{X}_{b}$ and the following equation holds:

$$
\frac{a \cdot 204.4}{a \cdot 204.4+b M_{x}}=0.895
$$

From the values $b=1,3$ and $a=1,2,3$ only $b=3, a=2$ gives a realistic $M_{X}$ $=16.0 \mathrm{~g} / \mathrm{mol}$.
$X$ is oxygen. 4 pts
Formula:

$$
\mathrm{Tl}_{2} \mathrm{O}_{3} .2 \text { pts }
$$

Equation:

$$
\begin{aligned}
& 2 \mathrm{Tll}_{3}+6 \mathrm{OH}^{-} \rightarrow \mathrm{Tl}_{2} \mathrm{O}_{3}+6 \mathrm{I}^{-}+3 \mathrm{H}_{2} \mathrm{O} \quad 3 \mathrm{pts} \\
& 2 \text { pts if } \mathrm{H}^{+} \text {or } \mathrm{H}_{3} \mathrm{O}^{+} \text {ions are written at the right side of the equation. }
\end{aligned}
$$

## Practical Problems

## Instructions

- This examination has $\mathbf{1 0}$ pages and $\mathbf{5}$ pages of answer sheets ( $8+4$ for Task 1-2, 2+1 for Task 3).
- You have 3 hours to complete Tasks 1 and 2. After that you will have to leave the laboratory for a short break while the assistants exchange your glassware and chemicals. You will then have 2 hours to work on Task 3.
- Begin only when the START command is given. You must stop your work immediately when the STOP command is given after each part. A delay in doing this by 3 minutes will lead to cancellation of your experimental exam.
- Follow safety rules given in the IChO regulations. At all times while you are in the laboratory you must wear safety glasses or your own glasses if they have been approved, and use the pipette filler bulb provided. Use gloves when handling the organic liquids.
- You will receive only ONE WARNING from the laboratory supervisor if you break safety rules. On the second occasion you will be dismissed from the laboratory with a resultant zero score for the entire experimental examination.
- Do not hesitate to ask a demonstrator if you have any questions concerning safety issues or if you need to leave the room.
- Use only the pen and calculator provided.
- Write your name and code on each answer sheet. Do not attempt to separate the sheets.
- All results must be written in the appropriate areas on the answer sheets. Anything written elsewhere will not be graded. Use the reverse of the sheets if you need scratch paper.
- You will need to reuse some glassware during the exam. Clean them carefully at the sink closest to you.
- Use the labeled waste containers under the hood for the disposal of organic liquids from Task 1 and all liquids from Task 3.
- The number of significant figures in numerical answers must conform to the rules of evaluation of experimental errors. Mistakes will result in penalty points, even if your experimental technique is flawless.
- Chemicals and laboratory ware are not supposed to be refilled or replaced. Each such incident (other than the first, which you will be allowed) will result in the loss of 1 point from your 40 practical points.
- When you have finished a part of the examination, you must put your answer sheets into the envelope provided. Do not seal the envelope.
- The official English version of this examination is available on request only for clarification.

## Apparatus

| For common use in the lab: |
| :--- |
| Heating block preadjusted to $70^{\circ} \mathrm{C}$ under the hood |
| Distilled water (H2O) in jugs for refill |
| Latex gloves (ask for a replacement if allergic to latex) |
| Labeled waste containers for Task 1 (organic liquids) and Task 3 (all liquids) |
| Container for broken glass and capillaries |
| On each desk: |
| Goggles |
| Heat gun |
| Permanent marker |
| Pencil and ruler |
| Stopwatch, ask supervisor about operation if needed. (You can keep it.) |
| Tweezers |
| Spatula |
| Glass rod |
| Ceramic tile |
| Paper tissue |
| Spray bottle with distilled water |
| 9 Eppendorf vials in a foam stand |
| TLC plate in labeled ziplock bag |
| Plastic syringe $\left(100 \mathrm{~cm}^{3}\right)$ with polypropylene filter disc |
| Pipette bulb |
| 14 graduated plastic Pasteur pipettes |
| Petri dish with etched competitor code |
| Burette |
| Stand and clamp |
| Pipette (10 $\left.\mathrm{cm}^{3}\right)$ |
| 2 beakers $\left(400 \mathrm{~cm}^{3}\right)$ |
| Beaker and watchglass lid with filter paper piece for TLC |
| 10 capillaries |
| 2 graduated cylinders $\left(25 \mathrm{~cm}^{3}\right)$ |
| 3 Erlenmeyer flasks $\left(200 \mathrm{~cm}^{3}\right)$ |
| Beaker (250 $\left.\mathrm{cm}^{3}\right)$ |
| 2 beakers $\left(100 \mathrm{~cm}^{3}\right)$ |
| Funnel |
| Volumetric flask (100 $\left.\mathrm{cm}^{3}\right)$ |
| 30 test tubes in stand |
| Indicator paper pieces and pH scale in ziplock bag* |
| Wooden test tube clamp* |
| 2 plugs for test tubes* |

* Only handed out for Task 3

## Chemicals

| 23 | Do not breathe fumes/vapour | 45 | In case of accident or if you feel unwell, seek medical advice immediately (show label where possible) |
| 25 | Avoid contact with eyes | 60 | This material and/or its container must be disposed of as hazardous waste |
| 26 | In case of contact with eyes, rinse immediately with plenty of water and seek medical advice | 61 | Avoid release to the environment. |
| Combination of Safety Precautions |  |  |  |
| 24/25 | Avoid contact with skin and eyes | 36/37/39 | Wear suitable protective clothing, gloves and eye/face protection |
| 36/37 | Wear suitable protective clothing and gloves |  |  |

## Task 1

## Synthesis of $\alpha$-D-glucopyranose pentaacetate

Caution: Use gloves while manipulating acetic acid and acetic anhydride. Let the lab supervisors know if any is spilled.

Add and mix $12 \mathrm{~cm}^{3}$ of pure acetic acid to $12 \mathrm{~cm}^{3}$ of acetic anhydride (provided in an Erlenmeyer flask) and add 3.00 g glucose (acetic anhydride is used in excess). Add with a Pasteur-pipette 5 drops of $30 \% \mathrm{HClO}_{4}$ dissolved in acetic acid. After the addition of the catalyst the solution might warm up considerably.
Let the mixture rest covered for 10 minutes and swirl it from time to time. Pour the reaction mixture into $100 \mathrm{~cm}^{3}$ of water in a beaker. Scratch the wall of the beaker with a glass rod to initiate crystallization, and let it crystallize for 10 minutes. Filter and wash the product two times with $10 \mathrm{~cm}^{3}$ of water using the syringe and the porous polypropylene filter disc.

## Filtration using a plastic syringe

1. Pull out the piston. Fill the syringe from above with the suspension to be filtered. The syringe can be filled to the level of the hole. Replace piston.
2. Cover the hole with your finger and press in the piston as far as the hole.
3. Open the hole and draw the piston back. Do not draw in air through the filter.
4. Repeat steps 2-3 a few times to expel the liquid.
5. Repeat steps $1-4$ until all solids are on the filter.
6. Press the piston against the filter cake and squeeze out the liquid.
7. Wash the product twice with $10 \mathrm{~cm}^{3}$ of water repeating steps $1-4$.
8. Press the piston against the filter cake and squeeze out the water.
9. Pull the piston out with the hole closed to lift out the filter cake. (Pushing with the end of the spatula can help.)
a) Place your product in the open Petri dish marked with your code. Leave it on your table. The organizers will dry it, weigh it and check it for purity.
b) Calculate the theoretical yield (mass) of your product in g. $(M(\mathrm{C})=12 \mathrm{~g} / \mathrm{mol}, M(\mathrm{O})=$ $16 \mathrm{~g} / \mathrm{mol}, M(\mathrm{H})=1.0 \mathrm{~g} / \mathrm{mol}$

## Synthesis of $\alpha$-D-glucopyranose pentaacetate from $\beta$-D-glucopyranose pentaacetate

An alternative synthesis of $\alpha$-D-glucopyranose pentaacetate starts from readily available $\beta$ -D-glucopyranose pentaacetate. In this experiment we will study the kinetics of this reaction with thin layer chromatography.

Add $1.5 \mathrm{~cm}^{3}$ acetic anhydride to 50 mg of anhydrous $\mathrm{ZnCl}_{2}$ (preweighed in a test tube). Add 100 mg of pure $\beta$-D-glucopyranose pentaacetate (BPAG) and swirl until dissolved. Take three drops from this mixture into an Eppendorf tube, add $0.5 \mathrm{~cm}^{3}$ methanol and save it.
Place the test tube in the heating apparatus under the hood closest to your desk. Place the test tube in the heating block preadjusted to $70^{\circ} \mathrm{C}$. Mix the contents of the test tube from time to time. During the reaction take three drops of sample from the mixture with a Pasteur pipet after 2, 5, 10, and 30 minutes. Mix immediately each sample with $0.5 \mathrm{~cm}^{3}$ of methanol to stop the reaction in an Eppendorf tube.
Prepare a silica TLC plate with the collected samples to study the reaction kinetics. Apply the necessary reference compounds as well to help identification of the spots on the plate. Mark the spots with a pencil, and develop the plate in isobutyl acetate/ isoamyl acetate (1:1) eluent. Heat the plates with a heat-gun (under the hood!) to visualise the spots (the colour is stable). You can ask for a second plate without penalty points if needed for proper evaluation.
c) Copy your plate on the answer sheet and place your plate in the labeled ziplock bag.
d) Interpret your experimental findings answering the questions on the answer sheet.

## Task 2

Insert this remark in your translation if your students do not know this kind of pipette. Hint: The pipette has two graduation marks. Stop at the second mark to measure out exact volumes. Do not let all the solution to run out.
When potassium hexacyanoferrate(II), $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ is added to a solution containing zinc ions, an insoluble precipitate forms immediately. Your task is to find out the composition of the stoichiometric precipitate that contains no water of crystallization.
The precipitation reaction is quantitative and so quick that it can be used in a titration. The end point can be detected using redox indication, but first the concentration of the potassium hexacyanoferrate(II) solution has to be determined.

## Preparation of $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ solution and determination of its exact concentration

Dissolve the solid $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] .3 \mathrm{H}_{2} \mathrm{O}(M=422.41 \mathrm{~g} / \mathrm{mol})$ sample in the small Erlenmeyer flask and quantitatively transfer it into the $100.00 \mathrm{~cm}^{3}$ volumetric flask. Take $10.00 \mathrm{~cm}^{3}$ portions of the hexacyanoferrate(II) solution. Add $20 \mathrm{~cm}^{3} 1 \mathrm{~mol} / \mathrm{dm}^{3}$ sulfuric acid and two drops of the ferroin indicator solution to each sample before titration. Titrate with the $0.05136 \mathrm{~mol} / \mathrm{dm}^{3} \mathrm{Ce}^{4+}$ solution. Repeat titration as necessary. Cerium(IV) is a strong oxidant under acidic conditions forming Ce (III).
a) Report the $\mathrm{Ce}^{4+}$ solution volumes consumed.
b) Give the equation for the titration reaction. What was the mass of your $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$ sample?

## The reaction between zinc ions and potassium hexacyanoferrate(II)

Take $10.00 \mathrm{~cm}^{3}$ of the hexacyanoferrate(II) solution and add $20 \mathrm{~cm}^{3} 1 \mathrm{~mol} / \mathrm{dm}^{3}$ sulfuric acid. Add three drops of indicator solution (diphenyl amine) and two drops of $\mathrm{K}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ solution. The indicator only works if the sample contains some hexacyanoferrate(III), $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$. Titrate slowly with the zinc solution. Continue until a bluish violet colour appears. Repeat titration as necessary.
c) Report the zinc solution volumes consumed.
d) Interpret the titration answering the questions on the answer sheet.
e) Determine the formula of the precipitate.

Caveat: Best marks are not necessarily awarded to measurements reproducing theoretically expected values.

## Task 3

Caution: Handle all unknown solutions as if they were toxic and corrosive. Discard them only in the appropriate waste container.
The heat gun heats the expelled air up to $500^{\circ} \mathrm{C}$. Do not direct the stream towards combustible materials or body parts. Be careful with the hot nozzle.
Always place a single piece of pumice into liquids before heating to avoid bumping. Never point the mouth of a heated test tube towards a person.

You have eight unknown aqueous solutions. Each solution contains only one compound. The same ion may appear in more than one solution. Every compound formally consists of one type of cation and one type of anion from the following list:

Cations: $\mathrm{H}^{+}, \mathrm{NH}_{4}^{+}, \mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{Mg}^{2+}, \mathrm{Al}^{3+}, \mathrm{K}^{+}, \mathrm{Ca}^{2+}, \mathrm{Cr}^{3+}, \mathrm{Mn}^{2+}, \mathrm{Fe}^{2+}, \mathrm{Fe}^{3+}, \mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Cu}^{2+}$, $\mathrm{Zn}^{2+}, \mathrm{Sr}^{2+}, \mathrm{Ag}^{+}, \mathrm{Sn}^{2+}, \mathrm{Sn}^{4+}, \mathrm{Sb}^{3+}, \mathrm{Ba}^{2+}, \mathrm{Pb}^{2+}, \mathrm{Bi}^{3+}$

Anions: $\mathrm{OH}^{-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}, \mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}, \mathrm{NO}_{2}{ }^{-}, \mathrm{NO}_{3}{ }^{-}, \mathrm{F}^{-}, \mathrm{PO}_{4}{ }^{3-}, \mathrm{HPO}_{4}{ }^{2-}, \mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, $\mathrm{SO}_{4}{ }^{2-}, \mathrm{HSO}_{4}^{-}, \mathrm{S}^{2-}, \mathrm{HS}^{-}, \mathrm{Cl}^{-}, \mathrm{ClO}_{4}^{-}, \mathrm{MnO}_{4}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{-}$

You have test tubes and heating but no additional reagents apart from distilled water and pH paper.

Identify the compounds in the solutions 1-8. You can use the solubility table for some of the anions on the next page. If you are unable to identify an ion exactly, give the narrowest selection possible.

## Remarks:

The unknown solutions may contain minor impurities arising from their exposure to air. The concentration of all solutions is around $5 \%$ by mass so you can expect clearly observable precipitates from the main components. In some cases, precipitation does not occur instantaneously; some substances may remain in an oversaturated solution for a while. Don't draw negative conclusions too hastily, wait 1-2 minutes where necessary. Always look carefully for all signs of a reaction.
Keep in mind that heating accelerates all processes, increases the solubility of most substances, and may start reactions that do not take place at room temperature.

## Solubility Table at $25^{\circ} \mathrm{C}$

|  | $\mathrm{NH}_{4}^{+}$ | $\mathrm{Li}^{+}$ | $\mathrm{Na}^{+}$ | $\mathrm{Mg}^{2+}$ | $\mathrm{Al}^{3+}$ | $\mathrm{K}^{+}$ | $\mathrm{Ca}^{2+}$ | $\mathrm{Cr}^{3+}$ | $\mathrm{Mn}^{2+}$ | $\mathrm{Fe}^{2+}$ | $\mathrm{Fe}^{3+}$ | $\mathrm{Co}^{2+}$ | $\mathrm{Ni}^{2+}$ | $\mathrm{Cu}^{2+}$ | $\mathrm{Zn}^{2+}$ | $\mathrm{Sr}^{2+}$ | $\mathrm{Ag}^{+}$ | $\mathrm{Sn}^{2+}$ | $\mathrm{Sn}^{4+}$ | $\mathrm{Sb}^{3+}$ | $\mathrm{Ba}^{2+}$ | $\mathrm{Pb}^{2+}$ | $\mathrm{Bi}^{3+}$ |

No entry: Soluble compound $\quad \downarrow$ : Insoluble compound $\quad$ R: Redox reaction at room temperature
HR: Soluble at room temperature. In hot solution a reaction with an observable effect (not necessarily a precipitate) takes place.
Solubilities in g (substance) / 100 g water. Accurately known values between 0.1 and 4 are shown only.
Precipitates whose colour significantly differs from that of their hydrated ions: $(\mathbf{B})=$ black, $(\mathbf{P})=$ purple, $(\mathbf{W})=$ white, $((\mathbf{Y}))=$ pale yellow, $(\mathbf{Y})=$ yellow .

## $10 \%$ of the total

| 1a | 1 b | 1c | 1d | Task 1 |
| :--- | :--- | :--- | :--- | :--- |
| 30 | 2 | 12 | 4 | 48 |
|  |  |  |  |  |

a) Yield of the product in g, measured by the organizer:

The samples are dried by the organisers. Full pts for a 60-100\% yield, linear scale between 0 $60 \%$ yield. The typical yield is $70 \%$.
Purity is checked by solubility (acetone) and TLC. If there is no insoluble material and no impurity is detectable by TLC, the full points for the yield are received.
If there is a considerable (easily visible) amount of insoluble material or impurity on the TLC plate, then 0 point is received for the yield (only possible in case of intentional contamination). 5 points off if filter disc is submitted.
b) Calculate the theoretical yield of your product in g.

$$
\begin{aligned}
& \mathrm{C}_{6} \mathrm{H}_{12} \mathrm{O}_{6} \rightarrow \mathrm{C}_{16} \mathrm{H}_{22} \mathrm{O}_{11} \\
& \mathrm{~m}=\frac{3.00 \mathrm{~g} \cdot 390 \mathrm{~g} / \mathrm{mol}}{180 \mathrm{~g} / \mathrm{mol}}=6.5 \mathrm{~g}
\end{aligned}
$$

Theoretical yield:
c) Sketch your developed TLC plate and leave on your desk to be evaluated,
$\square$
d) Interpret your experiment and choose the correct answer.

The acetylation reaction of glucose is exothermic.
$\square$ a) Yes
b) No
c) Cannot be decided based on these experiments

The isomerisation reaction of $\beta$-D-glucopyranose pentaacetate can be used for the preparation of pure $\alpha-D-g l u c o p y r a n o s e ~ p e n t a a c e t a t e . ~$a) Yes
b) No
c) Cannot be decided based on these experiments

Solutions: a, a (2 pts. each)

## Task 2

## $15 \%$ of the total

| 2a | 2b | 2c | 2 d | 2 e | Task 2 |
| :--- | :--- | :--- | :--- | :--- | :--- |
| 25 | 4 | 25 | 6 | 5 | 65 |
|  |  |  |  |  |  |

a) $\mathrm{Ce}^{4+}$ consumptions:

Full marks ( 25 pts.) if $V_{1}$ is within $0.15 \mathrm{~cm}^{3}$ of the expected value recalculated from the $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ mass. Zero marks if deviation is more than $0.50 \mathrm{~cm}^{3}$. Linear scale is applied in between.
Average volume consumed ( $V_{1}$ ):
b) The titration reaction:

$$
\begin{array}{ll}
\mathrm{Ce}^{4+}+\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}=\mathrm{Ce}^{3+}+\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-} & 2 \mathrm{pts} . \\
\text { or } \\
\mathrm{Ce}^{4+}+\mathrm{Fe}^{2+}=\mathrm{Ce}^{3+}+\mathrm{Fe}^{3+} & 1 \mathrm{pt}
\end{array}
$$

Calculation of sample mass:

$$
m=c_{c e} V_{1} 10 \cdot M \quad 2 \text { pts. }
$$

Actual sample masses will be distributed with the exam copies.
$\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right] \cdot 3 \mathrm{H}_{2} \mathrm{O}$ mass $(m)$ :
c) Zinc consumptions:

Full marks ( 25 pts.) if $V_{2}$ is within $0.15 \mathrm{~cm}^{3}$ of the expected value recalculated from $\mathrm{K}_{4}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]$ mass, zinc concentrations and empirical ratio. Zero marks if the deviation is more than $0.50 \mathrm{~cm}^{3}$. Linear scale is applied in between.
Average volume consumed $\left(V_{2}\right)$ :
d) Mark the correct answer.

The diphenyl amine indicator changes in colour at the end point
a) because the concentration of the $\mathrm{Zn}^{2+}$ ions increases.
b) because the concentration of the $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{4-}$ ions decreases.
c) because the concentration of the $\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]^{3-}$ ions increases.
d) because the indicator is liberated from its complex.

Which form of the indicator is present before the end point?

a) Oxidized
b) Reduced
c) Complexed to a metal ion

At the beginning of the titration the redox potential for the hexacyanoferrate(II) hexacyanoferrate(III) system is lower than the redox potential of the diphenyl amine indicator.
a) True
b) False

Solutions: b, b, a (2 pts. each)
e) Determine the formula of the precipitate. Show your work.

The mole ratio of the zinc:hexacyanoferrate(II) in the precipitate can be evaluated as:
$n_{\mathrm{Zn}} / n_{\mathrm{Fe}(\mathrm{CN})_{6}}=\frac{10 c_{\mathrm{Zn}} V_{2} M}{m}$
Values for $c_{Z n}$ are distributed according to country color (found on seating plan)
Red/Pink: 0.0500 Green: $0.0450 \quad$ Blue: $0.0475 \quad$ Yellow/lvory: 0.0525
The empirical ratio obtained from the experiments is 1.489.
Calculating the zinc/hexacyanoferrate(II) ratio:
Cations are needed to make the precipitate neutral and only potassium is present. The precipitate is $\mathrm{K}_{2} \mathrm{Zn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}$.

2 pts.
Any other reasonable calculation giving the same result is accepted.
Hydrogen instead of potassium $\left(\mathrm{H}_{2} \mathrm{Zn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}\right.$ or $\left.\mathrm{KHZn}_{3}\left[\mathrm{Fe}(\mathrm{CN})_{6}\right]_{2}\right)$ is also acceptable.

Mistakes in units, dilution factors, significant figures (not 3 or 4 in $2 b$ ) carry a penalty of 1 pt. in each calculation.

The formula of the precipitate:

## Task 3

## 15 \% of the total

| Task 3 |
| :--- |
| 108 |
|  |

Only fill out this table when you are ready with all your assignments.

|  | 1 | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ | $\mathbf{5}$ | $\mathbf{6}$ | $\mathbf{7}$ | $\mathbf{8}$ |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| Cation |  |  |  |  |  |  |  |  |
| Anion |  |  |  |  |  |  |  |  |

6 pts for each correctly identified ion except for $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{HS}^{-}$which are worth 12 pts, bringing up the total to 108 points.

Partial points will be awarded in the following cases:
Anions:
$\mathrm{AgNO}_{3}$ : Full points if $\mathrm{NO}_{3}{ }^{-}$is the only anion shown. 3 pts for $\mathrm{ClO}_{4}{ }^{-}$only. 3 pts if fluoride appears together with nitrate and/or perchlorate. Otherwise 0 pt.
$\mathrm{Pb}\left(\mathrm{CH}_{3} \mathrm{COO}\right)_{2}: 3$ pts if $\mathrm{NO}_{3}{ }^{-}$and/or $\mathrm{ClO}_{4}{ }^{-}$appear together with $\mathrm{CH}_{3} \mathrm{COO}^{-} .1$ pt for nitrate and/or perchlorate on their own. Otherwise 0 pt.
3 pts for $\mathrm{CO}_{3}{ }^{2-}$ instead of $\mathrm{HCO}_{3}^{-}$, and for $\mathrm{S}^{2-}$ instead of $\mathrm{HS}^{-}$.
Cations:
In the case of all alkali metal compounds, 2 pts for an incorrect alkali metal.
1 pt for $\mathrm{Ca}^{2+}$ or $\mathrm{Sr}^{2+}$ instead of $\mathrm{Ba}^{2+}$.

## Solution

The solutions received by the students contain the following compounds. The country colours can be found on the laboratory seating plan.

| Country colour | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Blue | $\mathrm{AgNO}_{3}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaOH | NaHS | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{Bal}_{2}$ | $\mathrm{MgSO}_{4}$ |
| Green | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaOH | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{AgNO}_{3}$ | $\mathrm{Bal}_{2}$ |
| Ivory | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{Bal}_{2}$ | $\mathrm{AgNO}_{3}$ | $\mathrm{MgSO}_{4}$ | NaHS | NaOH |
| L.Blue | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{BaI}_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{AgNO}_{3}$ | NaOH | $\mathrm{KHCO}_{3}$ |
| L.Green | $\mathrm{Bal}_{2}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{AgNO}_{3}$ | NaOH | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ |
| Pink | $\mathrm{MgSO}_{4}$ | NaOH | $\mathrm{AgNO}_{3}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{Bal}_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaHS |
| Red | NaOH | $\mathrm{Bal}_{2}$ | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{KHCO}_{3}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{AgNO}_{3}$ |
| Yellow | $\mathrm{KHCO}_{3}$ | $\mathrm{AgNO}_{3}$ | NaHS | $\mathrm{MgSO}_{4}$ | $\mathrm{Bal}_{2}$ | NaOH | $\mathrm{Pb}(\mathrm{OAc})_{2}$ | $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ |

The problem can be approached in many ways. Intuition is very helpful in the tentative assignment of some compounds in the early phases of the work. A systematic solution is given here for the blue Country colour.
All solutions are colourless (NaHS may be slightly yellowish because of polysulfide impurity). Solutions 1, 3, 6, 7, and 8 are practically neutral ( pH paper reading about 5-6). Solution 2 is basic $(\mathrm{pH}=9)$ while solutions 4 and 5 are very strongly basic $(\mathrm{pH}>11)$.
We can exclude all ions that only form coloured compounds in aqueous solutions: $\mathrm{Cr}^{3+}$, $\mathrm{Fe}^{2+}, \mathrm{Fe}^{3+}, \mathrm{Co}^{2+}, \mathrm{Ni}^{2+}, \mathrm{Cu}^{2+}$, and $\mathrm{MnO}_{4}^{-}$. (In principle we should also exclude $\mathrm{Mn}^{2+}$ but its solutions have a very light pink colour that might be mistaken for colourless. The yellowish solution is strongly basic hence its colour cannot be attributed to iron.) The compounds of $\mathrm{H}^{+}, \mathrm{Sn}^{2+}, \mathrm{Sn}^{4+}, \mathrm{Sb}^{3+}, \mathrm{Bi}^{3+}$, and $\mathrm{HSO}_{4}{ }^{-}$with the possible counter-ions could only exist in markedly acidic solutions; therefore they can also be safely excluded.

Thus the list of possible ions is:
Cations: $\mathrm{NH}_{4}^{+}, \mathrm{Li}^{+}, \mathrm{Na}^{+}, \mathrm{Mg}^{2+}, \mathrm{Al}^{3+}, \mathrm{K}^{+}, \mathrm{Ca}^{2+}, \mathrm{Mn}^{2+}, \mathrm{Zn}^{2+}, \mathrm{Sr}^{2+}, \mathrm{Ag}^{+}, \mathrm{Ba}^{2+}, \mathrm{Pb}^{2+}$.
Anions: $\mathrm{OH}^{-}, \mathrm{CO}_{3}{ }^{2-}, \mathrm{HCO}_{3}{ }^{-}, \mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{C}_{2} \mathrm{O}_{4}{ }^{2-}, \mathrm{NO}_{2}{ }^{-}, \mathrm{NO}_{3}^{-}, \mathrm{F}^{-}, \mathrm{PO}_{4}{ }^{3-}, \mathrm{HPO}_{4}{ }^{2-}, \mathrm{H}_{2} \mathrm{PO}_{4}^{-}$, $\mathrm{SO}_{4}{ }^{2-}, \mathrm{S}^{2-}, \mathrm{HS}^{-}, \mathrm{Cl}^{-}, \mathrm{ClO}_{4}^{-}, \mathrm{Br}^{-}, \mathrm{I}^{-}$.

The unknown solutions react with each other as follows ( $\downarrow=$ precipitate; $\uparrow=$ volatile product; "no change" means even when boiled, unless indicated otherwise):

|  | $\begin{gathered} 1 \\ \mathrm{AgNO}_{3} \end{gathered}$ | $\underset{\mathrm{KHCO}_{3}}{2}$ | $\begin{gathered} 3 \\ \mathrm{NH}_{4} \mathrm{ClO}_{4} \end{gathered}$ | $\begin{gathered} 4 \\ \mathrm{NaOH} \end{gathered}$ |  | $\begin{gathered} 6 \\ \mathrm{~Pb}(\mathrm{OAc})_{2} \end{gathered}$ | $\begin{gathered} 7 \\ \mathrm{Bal}_{2} \end{gathered}$ | $\underset{\mathrm{MgSO}_{4}}{8}$ |

(*): upon boiling, the formation of $\mathrm{NH}_{3}$ is detectable by its odour and by pH paper.
(**): gas bubbles are usually not observed when 2 is in excess.
(***): upon boiling, an odourless gas evolves and a white precipitate forms.
${ }^{(* * * *)}$ : upon boiling, a white precipitate forms and the odour of $\mathrm{H}_{2} \mathrm{~S}$ appears.
$2 \mathrm{Ag}^{+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{Ag}_{2} \mathrm{CO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Pb}^{2+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{PbCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Ba}^{2+}+2 \mathrm{HCO}_{3}^{-}=\mathrm{BaCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{Mg}^{2+}+2 \mathrm{HCO}_{3}{ }^{-}=\mathrm{MgCO}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$ (more accurately, basic carbonates of variable composition are formed)
$\mathrm{Ag}^{+}+\mathrm{I}^{-}=\mathrm{AgI} ; \quad 2 \mathrm{Ag}^{+}+\mathrm{SO}_{4}{ }^{2-}=\mathrm{Ag}_{2} \mathrm{SO}_{4} ; \mathrm{Ag}^{+}+\mathrm{CH}_{3} \mathrm{COO}^{-}=\mathrm{CH}_{3} \mathrm{COOAg}$
$\mathrm{Pb}^{2+}+2 \mathrm{OH}^{-}=\mathrm{Pb}(\mathrm{OH})_{2} ; \quad \mathrm{Pb}^{2+}+2 \mathrm{I}^{-}=\mathrm{Pbl}_{2} ; \quad \mathrm{Pb}^{2+}+\mathrm{SO}_{4}{ }^{2-}=\mathrm{PbSO}_{4}$
$\mathrm{K}^{+}+\mathrm{ClO}_{4}{ }^{-}=\mathrm{KClO}_{4} ; \quad \mathrm{Ba}^{2+}+\mathrm{SO}_{4}{ }^{2-}=\mathrm{BaSO}_{4} ; \quad \mathrm{Mg}^{2+}+2 \mathrm{OH}^{-}=\mathrm{Mg}(\mathrm{OH})_{2}$
$2 \mathrm{Ag}^{+}+2 \mathrm{OH}^{-}=\mathrm{Ag}_{2} \mathrm{O}+\mathrm{H}_{2} \mathrm{O}$
$2 \mathrm{Ag}^{+}+\mathrm{HS}^{-}=\mathrm{Ag}_{2} \mathrm{~S}+\mathrm{H}^{+} ; \mathrm{Pb}^{2+}+\mathrm{HS}^{-}=\mathrm{PbS}+\mathrm{H}^{+} ; \quad \mathrm{CH}_{3} \mathrm{COO}^{-}+\mathrm{H}^{+}=\mathrm{CH}_{3} \mathrm{COOH}$
$\mathrm{NH}_{4}{ }^{+}+\mathrm{OH}^{-}=\mathrm{NH}_{3}+\mathrm{H}_{2} \mathrm{O}$
$\mathrm{NH}_{4}{ }^{+}+\mathrm{HCO}_{3}{ }^{-}=\mathrm{NH}_{3}+\mathrm{CO}_{2}+\mathrm{H}_{2} \mathrm{O}$

Two groups of the observed phenomena give instant clues to the identification of some of the ions.

First, the reactions of $\mathbf{2}$ are often accompanied with the formation of a colourless and odourless gas that can only be $\mathrm{CO}_{2}$. Thus 2 contains $\mathrm{CO}_{3}{ }^{2-}$ or $\mathrm{HCO}_{3}{ }^{-}$.
Second, there are only 3 dark precipitates that can form from the given ions: $\mathrm{Ag}_{2} \mathrm{O}, \mathrm{Ag}_{2} \mathrm{~S}$, and PbS . This fact, together with the pH of the solutions, instantly identifies the cation of 1 as $\mathbf{A g}^{\mathbf{+}}$, the cation of $\mathbf{6}$ as $\mathbf{P b}^{\mathbf{2 +}}$, the anion of $\mathbf{4}$ as $\mathbf{O H}^{-}$, and the anion of $\mathbf{5}$ as sulfide or hydrosulfide (confirmed by the distinct smell of the solution).
The choice between the latter two can be made by measuring the pH of the solution formed in the reaction of $\mathbf{5}$ with an excess of $\mathbf{1}$ or $\mathbf{6}$. In the case of $\mathbf{1}$, the reaction mixture is strongly acidic. Thus the anion of 5 is $\mathrm{HS}^{-}$.
The evolution of $\mathrm{CO}_{2}$ in the reaction with $\mathrm{Ag}^{+}$and $\mathrm{Pb}^{2+}$ also identifies the anion of 2 as $\mathrm{HCO}_{3}{ }^{-}$. (in accord with the moderately basic pH )
The reaction of $\mathbf{3}$ and $\mathbf{4}$ yields ammonia. $\mathbf{4}$ is obviously not a solution of $\mathrm{NH}_{3}$ itself. Thus the cation of 3 is $\mathbf{N H}_{4}{ }^{+}$.
$2+4$ do not form either a precipitate or ammonia. The cations of $\mathbf{2}$ and $\mathbf{4}$ are $\mathrm{Na}^{+}$or $\mathrm{K}^{+}$.
$\mathbf{2 + 5}$ do not form either a precipitate or ammonia. The cation of 5 is an alkali metal.
3 is the only solution that does not give a precipitate with $\mathrm{Ag}^{+}$. Accordingly, it can be ammonium nitrate, fluoride, or perchlorate. But it does give a precipitate with 2, a hydrocarbonate of $\mathrm{Na}^{+}$or $\mathrm{K}^{+}$. Thus the anion of $\mathbf{3}$ is $\mathrm{ClO}_{4}{ }^{-}$and the cation of $\mathbf{2}$ is $\mathbf{K}^{+}$.
4 does not give a precipitate with $\mathrm{NH}_{4} \mathrm{ClO}_{4}$. The cation of 4 is $\mathbf{N a}^{+}$.
5 does not give a precipitate either with $\mathrm{NH}_{4} \mathrm{ClO}_{4}\left(\mathrm{~K}^{+}\right)$or with a mixture of $\mathrm{KHCO}_{3}$ and $\mathrm{NaOH}\left(\mathrm{Li}^{+}\right)$. The cation of 5 is $\mathrm{Na}^{+}$.
7 forms no precipitate or ammonia with NaOH but gives a precipitate with $\mathrm{KHCO}_{3} .7$ cannot be an alkali metal perchlorate because it forms yellow precipitates with 1 and 6 . Thus the cation of 7 is $\mathrm{Ba}^{2+}$ and the anion of 7 is $\mathrm{I}^{-}$.
At room temperature 8 gives a precipitate with $\mathrm{OH}^{-}$but not with $\mathrm{HS}^{-}$which means it can only be a salt of a Group 2A metal. Thus the reaction of 8 with $\mathrm{Bal}_{2}$ is obviously one
between $\mathrm{Ba}^{2+}$ and the anion of 8 . The latter is very likely $\mathrm{SO}_{4}{ }^{2-}$ but $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}$are also theoretically possible. The solution of 8 is unchanged upon boiling and gives a white precipitate with $\mathrm{Ag}^{+}$. This excludes both $\mathrm{HCO}_{3}{ }^{-}$and $\mathrm{H}_{2} \mathrm{PO}_{4}{ }^{-}$. Thus the anion of $\mathbf{8}$ is $\mathbf{S O}_{4}{ }^{2-}$. This instantly identifies the cation of $\mathbf{8}$ as $\mathbf{M g}^{\mathbf{2 +}}$.

6 is a soluble compound of lead. The anion could be $\mathrm{CH}_{3} \mathrm{COO}^{-}, \mathrm{NO}_{2}^{-}, \mathrm{NO}_{3}^{-}$, or $\mathrm{ClO}_{4}^{-}$. The slight odour of acetic acid might give a clue. Unlike 1, the reaction of an excess of $\mathbf{6}$ with $\mathrm{HS}^{-}$does not yield a markedly acidic solution which shows that $\mathbf{6}$ is a salt of a weak acid. If 6 were a nitrite, it would give a yellowish precipitate with $\mathrm{Ag}^{+}$. It would also react with $\mathrm{NH}_{4} \mathrm{ClO}_{4}$ upon heating with the evolution of $\mathrm{N}_{2}$ (and nitrogen oxides from the reaction with $\mathrm{HS}^{-}$would also be noticeable). The absence of these reactions indicates that the anion of 6 is $\mathrm{CH}_{3} \mathrm{COO}^{-}$.

Soluble salts of silver are even less numerous, the only choices are $\mathrm{NO}_{3}{ }^{-}, \mathrm{F}^{-}$, and $\mathrm{ClO}_{4}{ }^{-}$. The anion can be examined if one removes the silver ions from the solution of 1 with an excess of NaOH . The $\mathrm{Ag}_{2} \mathrm{O}$ precipitate quickly separates from the solution which can be easily poured off. This solution, containing the anion of 1, does not give a precipitate with $\mathrm{Bal}_{2}$ which rules out $\mathrm{F}^{-}$. The solubility of $\mathrm{KClO}_{4}$ is quite significant; therefore the absence of a precipitate with $\mathrm{KHCO}_{3}$ is inconclusive. The anion of 1 is therefore either $\mathrm{NO}_{3}{ }^{-}$or $\mathrm{ClO}_{4}{ }^{-}$.

## Results and Ranking

## Recipient of the Gedeon Richter Prize, the Servier-Egis Prize and the MOL Prize:

Yongping Fu, China

## Commendation of the Organizers for Theoretical Work:

Li Qian Yeong, Singapore

## Commendation of the Organizers for Practical Work

János Sarka, Hungary

## MINUTES

of the BUSINESS PART of the $1^{\text {st }}$ JURY SESSION at the $40^{\text {th }}$ ICHO/BUDAPEST

1. Introduction of the SC-members and description of the role of the SC and experts Dr. Kerschbaumer introduces the members of the Steering Committee to the International Jury. Additionally he describes the role of the Steering Committee, especially the work of the "experts".

Role of the SC:
$>$ to collect information about problems in the ICHO,
$>$ to try to find solutions for these problems,
$>$ to help the future hosts to organize the competition,
$>$ to handle and to conduct business sessions in the ICHO,
$>$ to decide about the IUPAC-support.
> Experts: people who contribute to and help in the organisation of ICHOs due to their experience as long time participating mentors or former hosts.
„Time table" of the SC :
> Constitution of the new SC after elections in one of the business sessions of the International Jury
$>$ New SC elects its chairman and decides about the experts
$>$ December meeting at the site of the upcoming ICHO
$>$ Whole time: intense communication via email between the SC-members
$>$ Meeting at the next ICHO
Comment from The Netherlands: If somebody is not elected and appears afterwards as an expert, why should there be an election at all.
Reply from András Kotschy (Hun): Electing should be for not against somebody. The SC elects and nominates the experts, not the International Jury.

## 2. Rearranged syllabus:

Gabor Magyarfalvi will present and discuss the rearranged syllabus in the third jury meeting. The draft version was sent out with the prep-problems.

## 3. Honesty issues - Moscow/Budapest:

$>$ Severe indication of cheating in the theoretical competition in Moscow by one country $\Rightarrow$
$>$ The mentors of the particular country were offered 0 points in the theoretical part, they accepted.
$>$ There is no regulation for consequences in the case of breaking rules for future Olympiads, so the country in question was invited to Hungary.
$>$ The SC decided in December to ask the country urgently not to send any of the persons involved in 2007 (mentors, observers, students).
$>$ Another consequence: "Awareness of regulations....", which every student had to sign.
$>$ Manfred Kerschbaumer reminds all delegations to § 11, section 7 of the regulations, and makes clear that the organizer of the $40^{\text {th }}$ ICHO and the SC will apply respective consequences to cheating countries and the persons involved.

## 4. Agenda for the Business Session ( $3^{\text {rd }}$ Jury session) of the IChO (draft):

$>$ Election of new SC-members: two from Europe, one from the Americas (proposals!)
$>$ Schedule for arbitration
$>$ Detailed information and voting on the acceptance of the restructured syllabus
$>$ Proposal and voting about changing the participation fee
$>$ Action to include a point in the regulations about safety

## 5. Agenda for the 4th jury meeting (draft):

$>$ Report on the IUPAC support
$>$ Allocation of the medals
$>$ Presentations by future hosts
$>$ Introduction of the new SC
$>$ Miscellaneous: statements and suggestions

Dr. Manfred Kerschbaumer<br>Chair of the Steering Committee of the IChO

MINUTES

## $3^{\text {rd }}$ JURY SESSION at the $40^{\text {th }}$ ICHO/BUDAPEST

## 1. Information by Anton Sirota

Anton Sirota (SIk) informs the International Jury that he has compiled the tasks from the first 20 IChOs. Every mentor will receive a CD with the tasks and the solutions. He asks the members of the IJ to indicate the source if they want to use the content of the CD.

## 2. Election of new SC-members:

Carlos Castro-Acuna and Sasha Gladilin collect the voting slips which were distributed together with the red and green voting cards. On these slips every country could write two names of nominees from Europe. After counting all the votes they announce the result:
Vadim Eremin: 43 votes
Wolfgang Hampe: 47 votes
Manfred Kerschbaumer: 27 votes
Vadim and Wolfgang are the elected members from Europe for 2009 and 2010.

## 3. Schedule for arbitaton:

Gabor Magyarfalvi informs the International Jury about the schedule for arbitration. The countries were divided into 6 groups by random, every country has 5 minutes per task.

## 4. Rearranged syllabus

Gabor Magyarfalvi presents and explains the rearranged syllabus. If the syllabus is accepted there must be several changes in $\S 10$ of the regulations. The new text of these sections in § 10 are presented on a slide.

Comment by Croatia: Others than SI-units should be allowed.

Voting about the changes in the regulations, and thus accepting the syllabus (a qualified majority is necessary):

## 52 votes in favour of changes

## 2 votes against the changes

The new syllabus and the changes are accepted.

## 5. Changing the participation fee:

As it is now: 100 US\$ per year since entering the Olympiad or having been the host, upper limit of 2000 US\$
Proposal: 200 US\$ per year since entering the Olympiad or having been the host, upper limit of 2000 US\$
Reason: No change in 10 years, different changes were discussed (change to $€$, higher upper limit)...
Long contribution and presentation from Uruguay with the aim to cancel the participation fee at all. One the major arguments: The sum of the participation fees in Moscow were a minor part of the total budget.
András (Hun): Another situation in Hungary, the participation fees amount to $8 \%$ of the total budget.
Manfred: The new fee starts with 2009!
Vadim: Participation fees in Moscow were also used as reserve in the budget.
Voting about the new proposal:

## 24 votes in favour of changes

30 votes against the changes
The new participation fee is rejected.
Uruguay proposes to cancel the participation fee entirely.
Peter Wothers (UK): Impossible to do that, because the money is already part of the calculated budget for 2009.
András: Consequence could be to reduce the invitation to one mentor.
Manfred: Charge for scientific observers and guests may be increased.
Head mentor from Israel asks the head mentor from Uruguay to withdraw the proposal.
Wesley Brown (Irl): There should not be a discussion about rich and poor countries, as he himself has to pay some expenses from his own pocket.
A lot of other remarks rejecting the idea about cancelling the participation fees are brought forward.
Finally the head mentor from Uruguay retrieves his proposal.
The SC will have this point on its agenda list for December 2009.

## 5. Information about safety:

Concerns § 12 of the regulations.
Possibility that the laws (regulations) of the host country are more strict concerning safety. Proposal:

If this is the case, they are valid, if they are less strict, the ICHO-regulations are valid:
The more strict regulations apply!

Dr. Manfred Kerschbaumer
Chair of the Steering Committee of the IChO

MINUTES
$4^{\text {th }}$ JURY SESSION at the $40^{\text {th }}$ ICHO/BUDAPEST

## 1. Report from the arbitration

Gabor Magyarfalvi reports from the arbitration which went on very smoothly. There were no long discussions with one exception. The time schedule was followed exactly.
2. Report on the IUPAC-support:

Money to be distributed: US $\$ 10.000$
Applications: US\$ 22.974

| Country | Amount | Purpose |
| :--- | :--- | :--- |
| Cuba | 2800 | P.F. and T.E. |
| Kyrgyzstan | 1740 | P.F. and T.E. |
| Peru | 500 | P.F. |
| Tajikistan | 1150 | T.E. |
| Uruguay | 2900 | P.F. and T.E. |
| Venezuela | 900 | P.F. |

P.F. = participation fee; T.E. = travel expenses

## 3. Presentation of the new SC:

Duckwhan Lee, the forthcoming chairman of the SC presents the newly constituted SC.

## 4. Cheating at the $\mathbf{4 0}^{\text {th }} \mathrm{IChO}$

András Kotschy reports about a case of cheating from Tajikistan. There is undisputed proof that in the hard copy version for the students (translation in Tajik) some additional information was included, whereas the electronic version (in Russian) did not contain any alterations.
András shows two examples to the International Jury concerning task No. 5 and Task No. 7.

He informs the International Jury about the decision of the organizer that the whole team of Tajikistan received 0 points on the whole competition. The International Jury now has to decide whether the country and/or the persons are banned for some time from the IChO. Israel: proposal to ban Tajikistan as a country for 5 years, the persons involved (mentors, students) must never come again.
Ukraine: proposal to ban Tajikistan forever
Australia: This would be a very hard decision and it will prevent future clever students who are totally innocent to participate. Proposal: banning for one year, persons are expelled forever.
Support by Slovakia and other countries.
Israel draws back the original proposal and affiliates the Australian proposal.
Voting about the proposal: 52 votes in favour of the proposal
The country Tajikistan will not participate in $41^{\text {st }} \mathrm{IChO}$ in the United Kingdom. The two mentors and the four students of the 2008 delegation of Tajikistan are expelled from the IChO forever.

## 5. Allocation of the medals

Gabor Magyarfalvi presents a graphic with a curve marks versus number of participant without showing the numbers at the $y$-axis.

According to major gaps the following numbers of medals are proposed:
Gold: 30; Silver: 52; Bronze: 79; Honourable mentions: 10
The proposal is accepted unanimously.

## 6. Presentation by future hosts

2009: Peter Wothers (UK) tells about the major issues of the $41^{\text {st }} \mathrm{IChO}$ in Cambridge and Oxford. The Catalyzer No. 1 will be distributed at the end of the Closing Ceremony of the $40^{\text {th }}$ IChO.
2010: Tadashi Watanabe (JPN) shows a detailed presentation about the state of organization of the $42^{\text {nd }} \mathrm{IChO}$.
The following IChOs will be held in (partly inofficial):
2011: Turkey; 2012: USA;
2013: Singapore; 2014: Vietnam; 2015: Thailand;

Closing the Business Session, the chairman of the SC, Manfred Kerschbaumer, expresses the appreciation of the whole community of the IChO for the perfect organization of the event in Budapest, and addresses his thanks especially to András Kotschy, the chairman of the organizing committee, and to Gabor Magyarfalvi, the chairman of the scientific board.

Dr. Manfred Kerschbaumer

Chair of the Steering Committee of the IChO

MINUTES of the SC-meeting from July $20^{\text {th }}, 2008$

András Kotschy as chairman of the Organizing Committee of ICHO40 asks for a short meeting of the SC to discuss an issue concerning the Tajikistan-case.
He asks the SC about their opinion to send an official letter to the authorities of Tajikistan about the cheating affair. The organizer will write a letter anyway, the question is, whether the SC joins in signing this letter.
Short discussion in which Vadim Eremin (Rus) points out that Tajikistan is not really a democratic country, and that therefore the personel consequences for the individuals involved may really be serious.

## Secret voting about the case, 8 persons entitled to vote.

## Result: 4:4

The chairman decides, that the SC will not write or be part of the letter in question.

Dr. Manfred Kerschbaumer

Chair of the Steering Committee of the IChO

## STEERING COMMITTEE OF THE ICHO

constituted on July 19, 2008

## Elected members:

Representatives of Europe:
Vadim Eremin (Russia); e-mail: vadim@educ.chem.msu.ru
Wolfgang Hampe (Germany); e-mail: hampe@t-online.de Wesley Browne(Ireland); e-mail: w.r.browne@rug.nl

Representative of the Americas
John Kiappes (USA); e-mail: jlkiappes@gmail.com
Representatives of Asia and the Pacific Rim:
Mark Ellison (Australia); e-mail: u3903111@anu.edu.au
Duckhwan Lee (Korea); e-mail: duckhwan@sogang.ac.kr

## Non-elected members:

Representatives of the organizers:
Gabor Magyarfalvi (Hungary); e-mail: gmagyarf@chem.elte.hu Peter Wothers (United Kingdom); e-mail: pdw12@cam.ac.uk Tadashi Watanabe (Japan); e-mail: watanabe@uiis.u-tokyo.ac.jp Jale Hacaloglu (Turkey); e-mail: jale@metu.edu.tr

Coopted members:
Manfred Kerschbaumer (Austria); e-mail: mkersch@gmx.net Juan-Antonio Renuncio (Spain); e-mail: renuncio@quim.ucm.es Anton Sirota (Slovakia); e-mail: anton.sirota@stuba.sk

## Budget of the $\mathbf{4 0}{ }^{\text {th }}$ IChO

EUR amounts are only approximate due to currency fluctuations.

|  |  |  | HUF | in EUR |
| :---: | :---: | :---: | :---: | :---: |
|  |  | Total budget of the 40th IChO | 212600000 | € 850400 |
| 1. |  | Government sources | 163400000 | $€ 653600$ |
| 2. |  | Sponsors | 20000000 | $€ 80000$ |
| 3. |  | Participation fees | 29200000 | $€ 116800$ |
|  |  | Expenditures of the 40th IChO | 212600000 | $€ 850400$ |
| 1. |  | Examination preparation | 17000000 | € 68000 |
|  | 1.1 | Equipment | 15000000 | $€ 60000$ |
|  | 1.2 | Reagents | 2000000 | $€ 8000$ |
| 2. |  | Accommodation and food | 82000000 | $€ 328000$ |
|  | 2.1 | Students | 27000000 | $€ 108000$ |
|  | 2.2 | Mentors | 55000000 | € 220000 |
| 3. |  | Transportation | 11200000 | € 44800 |
|  | 3.1 | Students | 7000000 | $€ 28000$ |
|  | 3.2 | Mentors | 4200000 | $€ 16800$ |
| 4. |  | Opening and closing ceremonies, banquet | 23400000 | € 93600 |
| 5. |  | Cultural program | 12000000 | € 48000 |
|  | 5.1 | Students | 8500000 | $€ 34000$ |
|  | 5.2 | Mentors | 3500000 | € 14000 |
| 6. |  | Secretariat | 19000000 | € 76000 |
|  | 6.1 | Staff costs | 13000000 | $€ 52000$ |
|  | 6.2 | Equipment and services | 6000000 | € 24000 |
| 7. |  | Guides | 13300000 | $€ 53200$ |
| 8. |  | Public relations | 5600000 | € 22400 |
|  | 8.1 | Catalyzers | 1500000 | $€ 6000$ |
|  | 8.2 | Souvenirs | 3600000 | € 14400 |
|  | 8.3 | Presentation, mass media | 500000 | € 2000 |
| 9. |  | 40th IChO IT support | 2500000 | € 10000 |
| 10. |  | Final report | 300000 | € 1200 |
| 11. |  | Operational expenses | 26300000 | $€ 105200$ |
|  | 11.1 | Personnel | 19000000 | $€ 76000$ |
|  | 11.2 | Consumables | 7300000 | € 29200 |

## Country Participation Fees

| Country | Years | Fee in USD | in EUR |
| :--- | ---: | ---: | ---: |
| Argentina | 14 | $\$ 1400$ | $€ 1050$ |
| Armenia | 3 | $\$ 300$ | $€ 225$ |
| Australia | 10 | $\$ 1000$ | $€ 750$ |
| Austria | 28 | $\$ 2000$ | $€ 1500$ |
| Azerbaijan | 9 | $\$ 900$ | $€ 675$ |
| Belarus | 13 | $\$ 1300$ | $€ 975$ |
| Belgium | 25 | $\$ 2000$ | $€ 1500$ |
| Brazil | 10 | $\$ 1000$ | $€ 750$ |
| Bulgaria | 27 | $\$ 2000$ | $€ 1500$ |
| Canada | 11 | $\$ 1100$ | $€ 825$ |
| China | 13 | $\$ 1300$ | $€ 975$ |
| Chinese Taipei | 3 | $\$ 300$ | $€ 225$ |
| Croatia | 9 | $\$ 900$ | $€ 675$ |
| Cuba | 16 | $\$ 1600$ | $€ 1200$ |
| Cyprus | 19 | $\$ 1900$ | $€ 1425$ |
| Czech Republic | 16 | $\$ 1600$ | $€ 1200$ |
| Denmark | 8 | $\$ 800$ | $€ 600$ |
| Egypt | 7 | $\$ 700$ | $€ 525$ |
| Estonia | 15 | $\$ 1500$ | $€ 1125$ |
| Finland | 20 | $\$ 2000$ | $€ 1500$ |
| France | 18 | $\$ 1800$ | $€ 1350$ |
| Germany | 4 | $\$ 400$ | $€ 300$ |
| Greece | 5 | $\$ 500$ | $€ 375$ |
| Hungary | 21 | $\$ 0$ | $€ 0$ |
| Iceland | 7 | $\$ 700$ | $€ 525$ |
| India | 7 | $\$ 700$ | $€ 525$ |
| Indonesia | 9 | $\$ 900$ | $€ 675$ |
| Iran | 16 | $\$ 1600$ | $€ 1200$ |
| Ireland | 11 | $\$ 1100$ | $€ 825$ |

# A Selection from Student Surveys 

## When and how did you get interested in Chemistry? Was there a spark in the beginning?

- Ireland: I have always been interested in chemistry. I want to become a medicinal chemist.
- Israel: Long, long time ago when I saw fireworks on Independence Day.
- Thailand: I am not really interested in it. I prefer arts.

## How did you prepare for the Olympiad?

- Ireland: By listening to Wesley (Browne)
- Hungary: Swimming, sauna, volleyball, table tennis, climbing and obviously a special diet.

## What do you expect from the competition?

- Croatia: A lot of new friends.
- Switzerland: Fun, fun and fun!
- Estonia: Nothing.
- Brazil: Personal and academic improvement.

How do you like Hungary?

- Thailand: I like everything here.
- Kuwait: The weather is just great. It rains in a good way.
- Turkmenistan: There are too many trees. We don't like the food.
- New Zealand: It striked us, how dangerous the country was despite it's small size: the streets are full of mad men drivers.

## What was the first thing here that caught your attention?

- Ireland: The heat.
- Lithuania: A whole bunch of "green" people. (i.e. the guides)
- Croatia: Other (female) competitors.

What do you know about Hungarian food, would you like to taste/have you ever tasted it?

- Italy: It is worse than Italian food.
- Slovenia: Hungarian food is very spicy, unhealthy and more like old-fashioned than sophisticated. I have tasted it while being here.

What was the strangest thing that you have experienced?

- Italy: During the re-union party, in a few second a terrible storm arrived. In Italy it never happens.
- Romania: That we had to wake up very early in the morning.
- Slovakia: Travelling by underground.
- Germany: The third exercise of the practical exam (qualitative analysis)

Which program did you like the most?

- Lithuania: I enjoyed most of having lunch at Eötvös University.
- Romania: The team-building games.
- Moldova: What I liked the most was the re-unoin party on Europa River Boat, it was awesome!

What will be waiting for you in your home country? Media, scholarships, etc.?

- Ireland: Probably the head of the Olympiad team with a disgusted expression on his face.
- Slovakia: My mother with good lunch.
- Israel: If we get medals, we will get prestigious scholarships.
- Thailand: Some pocket money.
